JOINT INSTITUTE FOR NUCLEAR RESEARCH

FLAGSHIP PROJECTS

DUBNA | 2023

WWW.JINR.INT

THE JOINT INSTITUTE FOR NUCLEAR RESEARCH

is an international intergovernmental organization, a world-famous scientific centre that integrates fundamental theoretical and experimental research with the development and application of advanced technology and university education.

The megascience project on the construction of the superconducting heavy ion collider NICA is being implemented at the Joint Institute.

JINR plays a significant role in the implementation of the megascience project on the construction of the Baikal-GVD deep-underwater neutrino telescope.

10 new elements have been discovered at JINR.

JINR is one of the organizers of the **International Year of Basic Sciences for Sustainable Development**

Dear colleagues and friends,

The Joint Institute for Nuclear Research in Dubna is an integral part of a global family of unique international research centres. Our mission is to provide the highest quality of the scientific agenda for cutting edge research and discoveries aimed to understand the fundamental properties of matter.

The JINR Long-Term Development Strategy up to 2030 and beyond is designed to strengthen our common international scientific family. The core research fields at JINR are Low-Energy Nuclear Physics, Relativistic Heavy Ion and Spin Physics, Particle Physics, Neutrino and Astroparticle Physics, Condensed Matter and Neutron Nuclear Physics, Radiobiology and Nuclear Medicine, Theoretical Physics, Information Technologies & High-Performance Computing. The foundation of the Institute is its world recognised scientific schools. The idea of neutrino oscillations, 10 new superheavy elements discovered, ultracold neutrons, superfluidity of the nuclear matter, postradiation recovery of cells, quantum field theory, harmonical superdimension in supersymmetry, a new generation of neutron pulsed reactors, and hyper convergent heterogeneous computing cluster — these are only some of visible scientific subjects associated with modern JINR.

Our Institute and its laboratories are also setting the agenda at the forefront innovations. To name just a few of these frontiers: novel materials and energetics, biomedicine, quantum technologies, data science, etc.

JINR is of course about basic science. No doubt that the quality of our scientific product is mainstaying on essential issues reinforcing us as a modern dynamic international intergovernmental scientific organization: worldwide scientific cooperation, science diplomacy, friendly social environment, digitalisation, innovation policy.

Our international team is diverse but united through the passion for research and sharing the value of international cooperation. The JINR Sofia Declaration signed in November 2021 highlights the value of international scientific and technological integration in solving the tasks of strengthening peace, mutual understanding, and socio-economic progress of all the countries.

JINR is open for attracting new partners and even entire regional clusters: science brings nations together. We feel obligated to use our scientific and integrating potential to promote peaceful scientific and technological progress in different parts of our planet.

Please, enjoy this brochure and become our missionary. On behalf of the JINR team I wish you pleasant acquaintance with our International Research Centre.

Grigory Trubnikov

Director of JINR

ORGANIZATION

The Committee of Plenipotentiaries of the Governments of the JINR Member States (CP), which is the supreme governing body of JINR, takes main decisions on the Institute's activities. The JINR Member States share the financing of the JINR activities and have equal rights in controlling the Institute. The Member States make contributions in the amount established by the Committee of Plenipotentiary Representatives. The Finance Committee and the Scientific Council operate under the CP JINR.

The research policy of JINR is determined by the Scientific Council. It consists of eminent scientists from world-leading scientific organizations and universities.

The Programme Advisory Committees (PACs) are advisory bodies to the JINR Directorate and to the JINR Scientific Council in three scientific fields: Particle Physics, Nuclear Physics, Condensed Matter Physics. The Programme Advisory Committees evaluate experimental projects proposed by scientific collaborations, institutes, JINR laboratories, and individual scientists.

The Science and Technology Council of the Institute is an advisory body to the Directorate of the Institute. It aims to ensure the participation of the scientific staff of the Institute in organizing its research activities. The immediate control over the JINR activity is exercised by the Directorate.

JINR IS
A MEMBER
OF **39**
COLLABORATIONS

CENTRES
AROUND THE WORLD

>900
PARTNER
NETWORK
ORGANIZATIONS

On 1 February 1957, JINR was registered by the United Nations.

On 24 September 1997, UNESCO and JINR signed an Agreement on Cooperation in Paris. Based on the agreement, the Institute became one of the international intergovernmental organizations associated with UNESCO.

MISSION AND GOALS

The Institute was established with the aim of uniting the efforts, scientific and material potential of its Member States for investigations of the fundamental properties of matter. Over 65 years JINR has accomplished a wide range of research and trained scientific staff of the highest quality for the Member States.

The concept of further development of JINR as a multidisciplinary international centre for fundamental research in nuclear physics

and related fields of science and technology implies efficient use of theoretical and experimental results, as well as methods and applied research at JINR in the field of high technology through their application in industrial, medical, and other kinds of technical development. The Institute's development strategy is detailed in the Seven-Year Plan for the Development of JINR.

INTERNATIONAL DIALOGUE FOR SCIENTIFIC INTEGRATION AND SCIENCE DIPLOMACY

SOFIA DECLARATION

A Declaration highlights the value of international scientific and technological integration in solving the tasks of strengthening peace, mutual understanding, and socio-economic progress of all the countries. The document was adopted on 22 November 2021, at the session of the Committee of Plenipotentiary Representatives of the Governments of the JINR Member States held in Bulgaria.

JINR FLAGSHIP PROJECTS

NICA: Nuclotron-based Ion Collider fAcility

SEARCH FOR NEW STATES OF NUCLEAR MATTER

Megascience project for research into the critical states of nuclear matter under extreme conditions, which occurred after the Big Bang at early stages of the Universe evolution using high-intensity heavy ion beams.

nica.jinr.ru

NICA covers an energy range where most important and interesting physics appears to take place — transition from hadronic to partonic effect dominance, possible appearance of first order phase transition in QCD phase diagram, transition from baryon to meson dominance in particle production.

NICA PARAMETERS

Range of nuclei: from hydrogen to bismuth, including gold

Energy of extracted beams: up to 4.5 GeV/N

Intensity (per second):
Heavy ions — $5 \cdot 10^8$
Protons — 10^{10}

Designed luminosity:
Heavy ions — $10^{27} \text{ cm}^{-2}/\text{s}^{-1}$

Light nuclei and polarised protons and deuterons — $10^{32} \text{ cm}^{-2}/\text{s}^{-1}$

$$\sqrt{s} = 4-11 \text{ GeV/N Energy} \quad \text{Collider ring circumference } 503 \text{ m}$$

APPLIED RESEARCH INFRASTRUCTURE FOR ADVANCE DEVELOPMENT AT NICA FACILITY

Channels for transporting charged particle beams and irradiation stations are being developed at NICA:

SOChI: Station Of Chip Irradiation,

IS CRA: Irradiation Station of Components of Radioelectronic Apparatus,

SIMBO: Station of Investigation of Medico-Biological Objects,

SHINE: Station of High Energy Investigation in Nuclear Energetic.

They are designed for research in the fields of life sciences, radiation materials science and radiation resistance of electronics, development of advanced technologies for nuclear power problems.

The NICA Accelerator Complex is a project allowing young specialists to join an ambitious scientific challenge. This unique research infrastructure is a magnet for talented youth from all the regions of the JINR location country — Russia — and other countries of the world.

NICA provides young people with a great opportunity to build successful careers in science and make the most of their potential, being members of the multinational team working at the forefront of science.

JINR FLAGSHIP PROJECTS

Synthesis of superheavy elements

JINR conducts advanced experiments on the synthesis of new superheavy elements.

The scientific programme includes experiments on the study of nuclear and chemical properties of new superheavy elements, reactions of fission, fusion, and multinucleon transfer in heavy-ion collisions.

AT PRESENT

The development of works in the fields of synthesis and property study of superheavy elements is associated with the creation of a new accelerator complex called the Superheavy Element Factory (SHE Factory) based on the DC-280 specialised cyclotron. The key task of the complex is to synthesise new chemical elements with atomic numbers 119, 120, and further, as well as to study in detail nuclear and chemical properties of the earlier synthesised superheavy elements.

Record parameters of accelerated heavy ion beams have been achieved at the Superheavy Element Factory accelerator complex. The ^{48}Ca beam intensity exceeds 7 puA. The ^{40}Ar beam at the SHE Factory has reached its designed intensity of 10 puA.

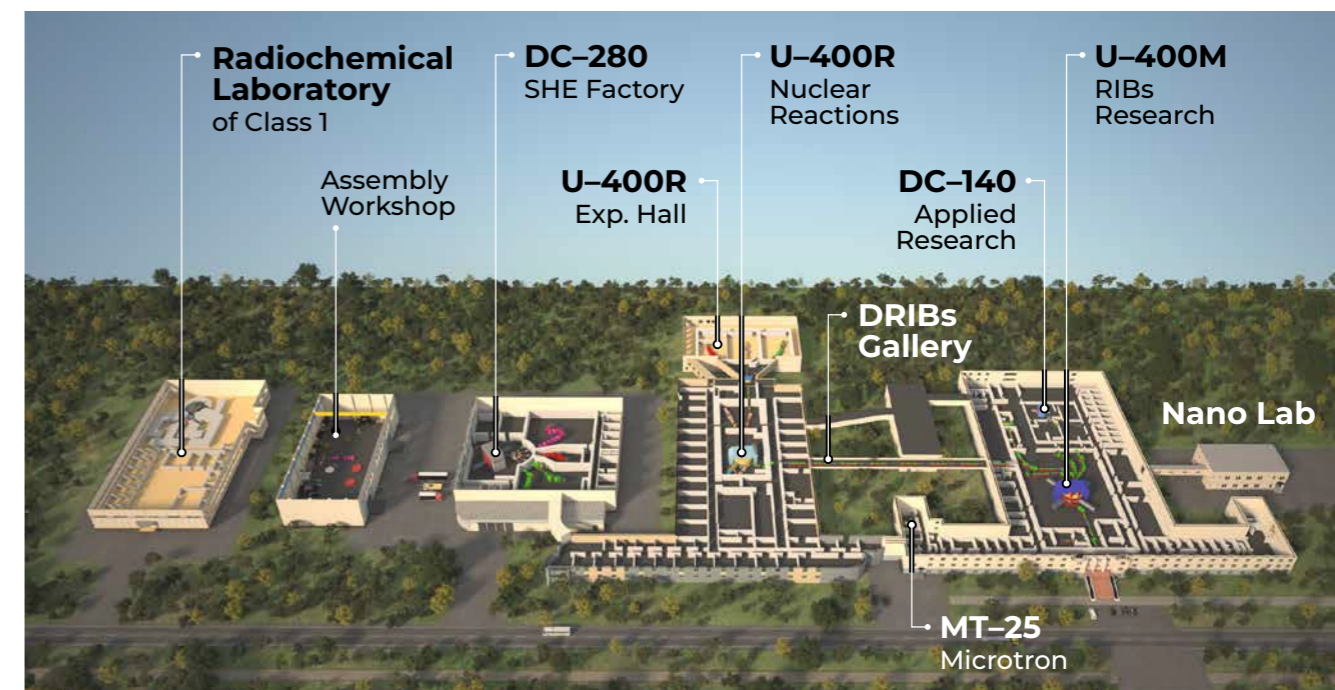

The scientific infrastructure of the SHE Factory is gradually improving: accelerators U-400 and U-400M are developing, a new facility DC-140 is under construction for applied research in the fields of track membranes and materials sciences.

5 NEW superheavy elements have been discovered at JINR that conclude period 7 of the Periodic Table for the past **25 years**

One of the results of global importance achieved by JINR scientists is the experimental proof of the existence of the “island of stability” of superheavy elements centred near $Z=114$ and $N=184$.

In November 2021, FLNR JINR Scientific Leader **Yuri OGANESSIAN**, who had new element 118 named after him for his pioneering contributions to transactinoid elements research, was awarded the UNESCO–Russia Mendeleev International Prize in the Basic Sciences “to acknowledge his breakthrough discoveries extending the Periodic Table and for his promotion of the basic sciences for development at the global scale.”

BASIC FACILITY — DRIBS-III ACCELERATOR COMPLEX

SUPERHEAVY ELEMENT Factory

SUMMARY OF EXPERIMENTS: 2020–2022

Strategic Research Directions:

- Heavy and superheavy nuclei
- Light exotic nuclei
- Radiation effects and nanotechnologies
- Accelerator technologies

238 new events of synthesis of superheavy nuclides

33 isotopes decays were studied

VS.

~100 events at all the facilities in the world, including in Dubna, since 1999

5 new isotopes were discovered:
 ^{286}Mc , ^{264}Lr , ^{276}Ds
 ^{268}Sg , ^{264}Lr

New decay modes:
 ^{268}Db (alpha-decay)
 ^{279}Rg (spontaneous fission)

Test of target stability up to 7 puA ^{48}Ca

JINR FLAGSHIP PROJECTS

Baikal-GVD

Baikal-GVD — deep underwater cubic-kilometre large neutrino telescope — is an international megascience project in the fields of neutrino physics and astrophysics.

The neutrino telescope Baikal-GVD is located in Lake Baikal 3.6 km away from the shore, at a depth of about 1,300 m. Baikal-GVD is the largest in the Northern Hemisphere and the second in size in the world.

Baikal-GVD: Identification of astrophysical sources of ultra-high energy (exceeding tens of TeV) neutrinos.

Topicality: their sources are still unknown. The identification of sources will help to elucidate the mechanisms of galaxies creation and evolution. This unique scientific facility is an important tool of multi-messenger astronomy, a new powerful method to investigate the Universe.

Baikal-GVD is one of the three neutrino telescopes across the world and, along with IceCube at the South Pole and KM3NeT (former ANTARES) in the Mediterranean Sea, is part of the Global Neutrino Network (GNN).

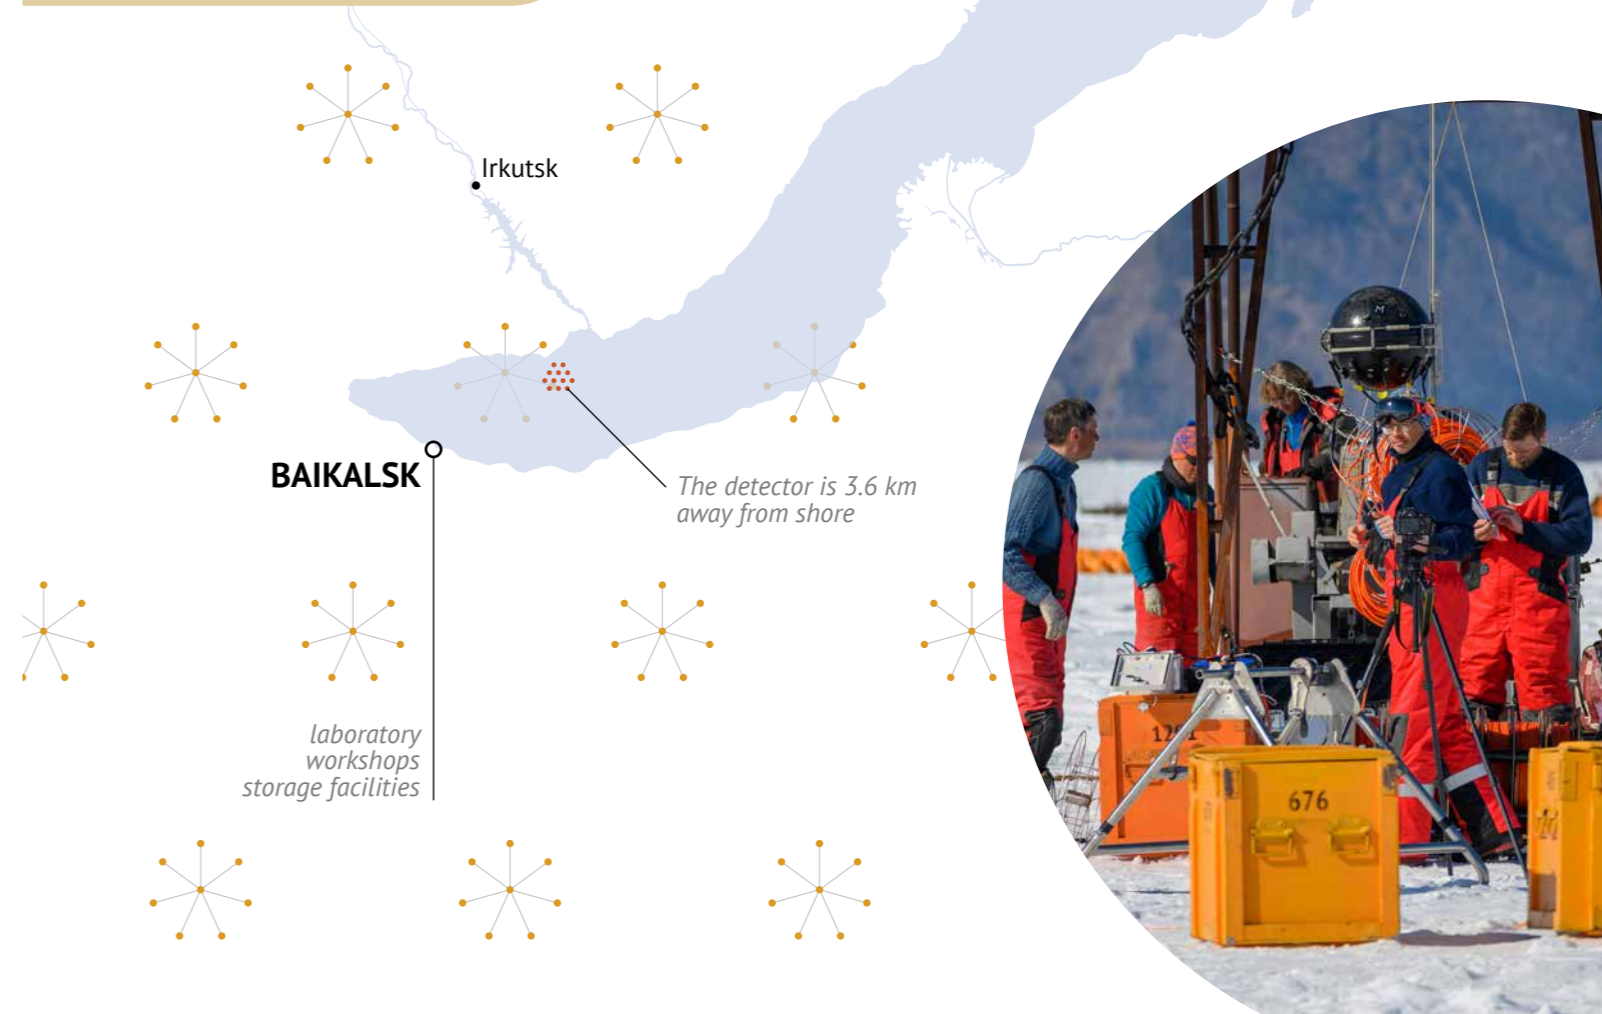

The Baikal-GVD Neutrino Telescope is being constructed by the international collaboration with a leading role of the RAS Institute for Nuclear Research (Moscow) and the Joint Institute for Nuclear Research.

AT PRESENT

During the last Baikal expedition, the collaboration of the project successfully installed two new clusters of the neutrino telescope. Since 12 April, all 10 installed clusters have been collecting data.

INSTALLED	in 2022	total
Clusters	2	10
Optical Modules	684	2,988
Optical + acoustic cables, km	84	420
High-voltage bottom cables, km	15	75

In December 2021, the IceCube Neutrino Observatory at the South Pole announced the observation of a track, a candidate for the astrophysical neutrino with an estimated energy of about 172 TeV. Four hours later, an interaction of another neutrino coming in from the same direction with an estimated energy of 43 TeV was found in the Baikal-GVD data. The first 10 events were selected as astrophysical neutrino candidates after the analysis of the 2018–2020 data.
