JOINT INSTITUTE FOR NUCLEAR RESEARCH

**TOPICAL PLAN
FOR JINR RESEARCH
AND INTERNATIONAL COOPERATION
2027**

All the Themes or Activities in the Plan are listed by fields of research. Each Theme or Activity is coded according to the JINR system of classification and contains the following information:

- | | |
|-------------------------------------|--|
| the first number [*] | - the field of research; |
| the second number ^{**} | - the conventional number of laboratory; |
| the third number | - the theme's or activity's ordinal number; |
| the fourth and
the fifth numbers | - the years of the theme's or activity's beginning and completion. |

All the Projects (Subprojects) in the Plan are listed by Themes. Each Projects (Subproject) is coded according to the JINR system of classification and contains the following information:

- | | |
|------------------------------------|---|
| the first number [*] | - the field of research; |
| the second number ^{**} | - the conventional number of laboratory; |
| the third number | - the theme's ordinal number; |
| the fourth number | - the project's (subproject's) ordinal number; |
| the fifth and
the sixth numbers | - the years of the project's (subproject's) beginning and completion. |

- | | |
|--|---|
| <p>[*] 01 - Theoretical Physics</p> <p>02 - Elementary Particle Physics and
High-Energy Heavy-Ion Physics</p> <p>03 - Nuclear Physics</p> <p>04 - Condensed Matter Physics</p> <p>05 - Radiation Research in Life Sciences</p> <p>06 - Information Technology</p> <p>07 - Applied Innovation Activities</p> <p>08 - Physics and Technology of Charged
Particle Accelerators</p> <p>09 - Organization of Scientific Activity
and International Cooperation.
Strengthening Human Resources.
Educational Programme</p> | <p>^{**} 0 - All-Institute topics</p> <p>1 - VBLHEP
Veksler and Baldin Laboratory of High Energy Physics</p> <p>2 - DLNP
Dzhelepov Laboratory of Nuclear Problems</p> <p>3 - BLTP
Bogoliubov Laboratory of Theoretical Physics</p> <p>4 - FLNP
Frank Laboratory of Neutron Physics</p> <p>5 - FLNR
Flerov Laboratory of Nuclear Reactions</p> <p>6 - MLIT
Meshcheryakov Laboratory of Information Technologies</p> <p>7 - LRB
Laboratory of Radiation Biology</p> <p>8 - DSOA
Department of Science Organization Activities</p> <p>9 - UC
University Centre</p> |
|--|---|

Contents

List of projects and subprojects

JINR Large Research Infrastructure

02-1-1065-2007/2031	NICA Complex Design and Construction of the Complex of Accelerators, Collider and Physics Experimental Facilities at Extracted and Colliding Ion Beams Aimed at Studying Dense Baryonic Matter and the Spin Structure of Nucleons and Light Ions, and at Carrying out Applied and Innovation Projects V.D. Kekelidze, A.V. Butenko, G.V. Trubnikov	12
02-2-1148-2010/2028	Baikal-GVD Baikal Deep Underwater Gigaton Volume Neutrino Telescope I.A. Belolaptikov	25
06-6-1118-2014/2030	MICC Multifunctional Information and Computing Complex V.V. Korenkov, S.V. Shmatov	27
03-5-1129-2017/2028	DRIBs-III Development of the FLNR Accelerator Complex and Experimental Setups I.V. Kalagin, S.I. Sidorchuk	33
04-4-1149-2024/2028	Pulsed Neutron Source and the Complex of Spectrometers E.V. Lychagin, S.A. Kulikov	36

Theoretical Physics (01)

01-3-1135-2019	Fundamental Interactions of Fields and Particles D.I. Kazakov, O.V. Teryaev	54
01-3-1136-2019	Theory of Nuclear Systems N.V. Antonenko, A.A. Dzhioev, S.N. Ershov	66
01-3-1137-2019	Theory of Complex Systems and Advanced Materials V.A. Osipov, A.M. Povolotskii	76
01-3-1138-2019	Modern Mathematical Physics: Integrability, Gravity and Supersymmetry A.P. Isaev, S.O. Krivonos	84

Elementary Particle Physics and High-Energy Heavy-Ion Physics (02)

Participation in the International Experiments

02-1-1066-2007	Investigation of the Properties of Nuclear Matter and Particle Structure at the Collider of Relativistic Nuclei and Polarized Protons R. Lednický, Yu.A. Panebrattsev	93
02-2-1081-2009	ATLAS Upgrade of the ATLAS Detector and Physics Research at the LHC V.A. Bednyakov	99
02-1-1083-2009	CMS Compact Muon Solenoid at the LHC V.Yu. Karjavin	102
02-2-1085-2009	Experimental Tests of the Fundamentals of QCD A.V. Guskov	108

02-1-1087-2009	Research on Relativistic Heavy and Light Ion Physics Experiments at the Accelerator Complex Nuclotron-M/NICA at JINR and CERN SPS A.I. Malakhov, S.V. Afanasiev	111
02-1-1088-2009	ALICE Study of Interactions of Heavy Ion and Proton Beams at the LHC A.S. Vodopyanov	117
02-1-1096-2010	Study of Rare Charged Kaon Decays and Search for Dark Sector in Experiments at the CERN SPS V.D. Kekelidze	123
02-2-1151-2025	Development of Advanced Detectors and Analysis Methods, Hadronic and Rare Leptonic Processes Yu.I. Davydov	126
<i>Experiments at the NICA Accelerator Complex</i>		
02-1-1086-2009	Strangeness in Hadronic Matter and Study of Inelastic Reactions Near Kinematical Borders E.A. Stokovsky, E.S. Kokoulina, D.O. Krivenkov	129
02-1-1097-2010	Study of Polarization Phenomena and Spin Effects at the JINR Nuclotron-M/NICA Facility V.P. Ladygin	133
02-1-1150-2025	Fundamental and Applied Physics Research with Relativistic Particle Beams A.A. Baldin	138
<i>Neutrino Physics and Astrophysics</i>		
02-2-1099-2010	Study of Neutrino Oscillations and Astrophysical Research D.V. Naumov, A.G. Olshevskiy	143
02-2-1144-2021	Search for New Physics in the Lepton Sector Z. Tsamalaidze	148
Nuclear Physics (03)		
03-4-1146-2024	Neutron Nuclear Physics Yu.N. Kopatch, P.V. Sedyshev, V.N. Shvetsov	152
03-5-1130-2017	Synthesis and Properties of Superheavy Elements, Structure of Nuclei at the Limits of Nucleon Stability S.I. Sidorchuk	163
03-2-1100-2010	Non-Accelerator Neutrino Physics and Astrophysics E.A. Yakushev, S.V. Rozov	167
Condensed Matter Physics (04)		
04-4-1147-2024	Optical Methods in Condensed Matter Studies G.M. Arzumanyan, N. Kučerka	177
Radiation Research in Life Sciences (05)		
05-7-1077-2009	Research on the Biological Effects of Ionizing Radiations with Different Physical Characteristics A.N. Bugay	180
05-2-1132-2017	Study of Molecular Genetic Mechanisms of Adaptations of Extremophilic Organisms E.V. Kravchenko	187

Information Technology (06)

06-6-1119-2014	Methods, Algorithms and Software for Modeling Physical Systems, Mathematical Processing and Analysis of Experimental Data S.V. Shmatov, O. Chuluunbaatar	190
----------------	---	-----

Applied Innovation Activities (07)

07-1-1107-2011	Applied Research at NICA in Radiation Materials Sciences, Life Sciences and New Methods of Energy Production O.V. Belov, E.M. Syresin	200
07-5-1131-2017	Radiation Materials Science, Nanotechnological and Biomedical Investigations with Heavy-Ion Beams P.Yu. Apel	206
07-1-A001-2025/2027	Creation of a Line of High-Voltage Power Supplies and Voltage Switches for Experimental Facilities D.O. Ponkin	211
07-2-A002-2025/2028	Development of Deep Tissue Oxygenation Measurement Systems Using Time-Domain Diffuse Optics (TD-DO) A.S. Selyunin	212
07-2-A003-2025/2028	Development of Micro-SPECT Systems for Precision Imaging in Preclinical Biological Experiments V.A. Rozhkov	213
07-4-A004-2025/2028	Testing of Neurotoxicity and Assessment of Contrast Agents, Nanoparticles and Other Compounds Accumulation in Animal Models in TaaS format I. Zincovscaia	215
07-5-A005-2025/2028	Multifunctional Preparative Tangential Filtration System I.V. Vinogradov	216

Physics and Technology of Charged Particle Accelerators (08)

08-2-1126-2015	Development of Scientific DLNP Infrastructure for Research Using Semiconductor Detectors, Laser Metrology, Electrons, Positrons and Cryogenic Technology V.V. Glagolev, G.A. Shelkov	218
08-2-1127-2016	Advanced Studies of Systems of New-Generation Accelerators and Colliders for Fundamental and Applied Research G.V. Trubnikov, B.N. Gikal	225

Organization of Scientific Activities and International Cooperation. Strengthening Human Resources. Educational Programme (09)

09-8-1037-2001	Analytical and Methodological Developments for the Organization of Scientific Research and International Cooperation in the Main Directions of JINR Development A.V. Matveev, S.N. Nedelko, O.-A. Culicov	231
09-9-1139-2019	Scientific and Educational Programmes for the Training of Highly Qualified Personnel G.V. Trubnikov, D.V. Kamanin, W. Badawy	235
09-3-1117-2014	DIAS-TH Dubna International Advanced School of Theoretical Physics I.G. Pirozhenko	243

Alphabetical List of Collaborators**245**

List of projects and subprojects of the JINR Topical Plan for 2027

Project (subproject) code		Name of the project (subproject) and project leaders	
JINR Large Research Infrastructure			
1.	02-1-1065-1-2011/2027	Nuclotron-NICA A.V. Butenko, E.M. Syresin	13
2.	02-1-1065-2-2012/2031	BM@N M.N. Kapishin	16
3.	02-1-1065-3-2011/2030	MPD V.M. Golovatyuk, V.D. Kekelidze, V.G. Ryabov	17
4.	02-1-1065-4-2020/2029	SPD A.V. Guskov	19
5.	02-2-1148-1-2010/2028	Baikal-GVD I.A. Belolaptikov	25
6.	06-6-1118-1-2014/2030	MICC. Multifunctional Information and Computing Complex V.V. Korenkov, S.V. Shmatov	27
7.	03-5-1129-1-2024/2028	Construction of the U-400R accelerator complex I.V. Kalagin, A.V. Karpov	33
8.	03-5-1129-2-2024/2028	Development of the experimental setups to study the chemical and physical properties of superheavy elements S.I. Sidorchuk	34
9.	04-4-1149-2-2021/2028	Investigations of functional materials and nanosystems using neutron scattering D.P. Kozlenko, V.L. Aksenov, A.M. Balagurov	37
	<i>04-4-1149-2-1-2024/2028</i>	<i>Study of structure and dynamics of functional materials and nanosystems at the IBR-2 spectrometer complex</i> D.P. Kozlenko	39
	<i>04-4-1149-2-2-2021/2028</i>	<i>Development of an inelastic neutron scattering spectrometer in inverse geometry BJN (Bajorek-Janik-Natkaniec) at the IBR-2 reactor</i> E.V. Raksha, E.A. Goremychkin	41
10.	04-4-1149-3-2021/2028	Scientific and methodological research and developments for condensed matter investigations with IBR-2 neutron beams V.I. Bodnarchuk, V.I. Prihodko	44
	<i>04-4-1149-3-2-2024/2028</i>	<i>Vector magnet for investigations with polarized neutrons</i> A.N. Chernikov	46
	<i>04-4-1149-3-3-2024/2028</i>	<i>Design and development of infrastructure elements for spectrometers at the IBR-2 reactor</i> V.I. Bodnarchuk, V.I. Prihodko, M.V. Bulavin	47
11.	04-4-1149-4-2021/2028	New advanced neutron source at JINR E.V. Lychagin, V.N. Shvetsov, M.V. Bulavin	49
	<i>04-4-1149-4-1-2024/2028</i>	<i>Research and development for the justification of the draft design of the new advanced neutron source at JINR – NEPTUN pulsed fast reactor</i> E.V. Lychagin, V.N. Shvetsov, M.V. Bulavin	51

Theoretical Physics (01)

12.	01-3-1135-1-2024/2028	Quantum field theory and physics beyond the Standard Model D.I. Kazakov, A.V. Bednyakov	54
13.	01-3-1135-2-2024/2028	QCD and hadron structure I.V. Anikin, S.V. Mikhailov, O.V. Teryaev	57
14.	01-3-1135-3-2024/2028	Phenomenology of strong interactions and precision physics V.I. Korobov, M.A. Ivanov	59
15.	01-3-1135-4-2024/2028	Theory of hadronic matter under extreme conditions V.V. Braguta, E.E. Kolomeitsev, S.N. Nedelko	60
16.	01-3-1135-5-2024/2028	Theory of electroweak interactions and neutrino physics A.B. Arbuzov, V.A. Naumov	61
17.	01-3-1136-1-2024/2028	Microscopic models for exotic nuclei and nuclear astrophysics A.A. Dzhioev	66
18.	01-3-1136-2-2024/2028	Low-energy nuclear dynamics and properties of nuclear systems S.N. Ershov, G.G. Adamian	68
19.	01-3-1136-3-2024/2028	Quantum few-body systems A.K. Motovilov, V.S. Melezhik	69
20.	01-3-1136-4-2024/2028	Relativistic nuclear dynamics and nonlinear quantum processes S.G. Bondarenko, A.B. Larionov	70
21.	01-3-1137-1-2024/2028	Complex materials E.M. Anitas	76
22.	01-3-1137-2-2024/2028	Mathematical models of statistical physics of complex systems A.M. Povolotsky	78
23.	01-3-1137-3-2024/2028	Nanostructures and nanomaterials V.A. Osipov, V.L. Katkov	79
24.	01-3-1137-4-2024/2028	Quantum field theory methods in complex systems M. Hnatič	80
25.	01-3-1138-1-2024/2028	Integrable systems and symmetries A.P. Isaev, S.O. Krivonos, N.A. Tyurin	84
26.	01-3-1138-2-2024/2028	Supersymmetry, higher spins, gravity E.A. Ivanov, S.A. Fedoruk	85
27.	01-3-1138-3-2024/2028	Quantum gravity, cosmology and strings I.G. Pirozhenko, D.V. Fursaev	87

Physics of Elementary Particles and High-Energy Heavy Ion Physics (02)***Participation in international experiments***

28.	02-1-1066-1-2010/2029	STAR Yu.A. Panebrattsev, R. Lednický	93
29.	02-2-1081-1-2010/2030	ATLAS. Detector upgrade and physics at the LHC V.A. Bednyakov	99

30.	02-1-1083-1-2010/2030	CMS. Physical studies at the CMS experiment and the second phase of detector upgrade for operation in high luminosity conditions V. Yu. Karjavin	102
31.	02-2-1085-1-2007/2028	BESIII I.I. Denisenko	108
32.	02-2-1085-2-2024/2029	NA66/AMBER. Study of the fundamental properties of hadrons A.V. Guskov	109
33.	02-1-1087-1-2012/2028	NA61/SHINE A.I. Malakhov	111
34.	02-1-1087-2-2017/ 2027	SCAN-3 S.V. Afanasyev	112
35.	02-1-1088-1-2010/2030	ALICE A.S. Vodopyanov	117
36.	02-1-1096-1-2010/ 2027	NA62 V.D. Kekelidze	123
37.	02-1-1096-2-2017/2031	NA64 V.A. Matveev, D.V. Peshekhonov	124
38.	02-2-1151-1-2025/ 2027	Development of a physics program and detectors for experiments at CEPC Yu.I. Davydov, A.S. Zhemchugov	126
<i>Experiments at the NICA accelerator complex</i>			
39.	02-1-1086-1-2025/2029	HyperNIS-SRC. HyperNuclear Intrinsic Strangeness and Short-Range Correlations D.O. Krivenkov, Yu. Lukstins	129
40.	02-1-1097-1-2010/ 2027	ALPOM-2 N.M. Piskunov	133
41.	02-1-1097-2-2010/ 2027	DSS V.P. Ladygin	134
42.	02-1-1150-1-2025/2029	FLAP. Fundamental&applied research with beams of relativistic accelerated electrons A.A. Baldin	138
<i>Neutrino physics and astrophysics</i>			
43.	02-2-1099-1-2009/2031	JUNO D.V. Naumov	143
44.	02-2-1099-4-2026/2028	Study of neutrino properties in accelerator experiments L.D. Kolupaeva, A.G. Olshevskiy	144
45.	02-2-1099-3-2015/2029	TAIGA A.N. Borodin	144
46.	02-2-1144-1-2021/2029	COMET Z. Tsamalaidze	148

Nuclear Physics (03)

47. 03-4-1146-1-2014/2028	TANGRA. Development and elaboration of the tagged neutron method for determining the elemental structure of matter and studying nuclear reactions Yu.N. Kopatch	153
48. 03-4-1146-2-2022/2027	Modernization of the EG-5 accelerator and its experimental infrastructure A.S. Doroshkevich	154
49. 03-4-1146-3-2022/2028	Investigations of neutron nuclear interactions and properties of the neutron V.N. Shvetsov, P.V. Sedyshev	155
50. 03-4-1146-4-2026/2027	Development of the concept of an ultracold neutron (UCN) source at the IBR-2 pulsed reactor V.N. Shvetsov, V. Kulin	157
51. 03-5-1130-1-2024/2028	Investigation of heavy and superheavy elements M.G. Itkis, A.V. Karpov	163
52. 03-5-1130-2-2024/2028	Light exotic nuclei at the borders of nucleon stability G. Kaminski, S.I. Sidorchuk	164
53. 03-2-1100-1-2024/2028	Radiochemistry and spectroscopy for astrophysics and nuclear medicine D.V. Filosofov	167
54. 03-2-1100-2-2024/2028	Investigations of reactor neutrinos on a short baseline I. Zhitnikov	170
55. 03-2-1100-3-2024/2028	Nuclear spectrometry for the search and investigation of rare phenomena D. Zinatulina	171

Condensed Matter Physics (04)

56. 04-4-1147-1-2024/2028	NANOBIOPHOTONICS G.M. Arzumanyan, K.Z. Mamatkulov	177
---------------------------	--	-----

Radiation Research in Life Sciences (05)

57. 05-7-1077-1-2024/2028	Molecular, genetic and organism effects of ionizing radiations with different physical characteristics A.V. Boreyko, P.N. Lobachevsky	180
58. 05-7-1077-2-2024/2028	Radiation-biophysical and astrobiological research D.I. Padron, A.Yu. Rozanov	182
59. 05-2-1132-1-2021/2028	TARDISS. Protection Against Physical and Chemical Stresses with Tardigrade Proteins E.V. Kravchenko	187

Information Technology (06)

60. 06-6-1119-1-2024/2031	Mathematical methods, algorithms and software for modeling physical processes and experimental facilities, processing and analyzing experimental data S.V. Shmatov	191
61. 06-6-1119-2-2024/2031	Methods of computational physics for the study of complex systems E.V. Zemlyanaya, O. Chuluunbaatar	193

Applied Innovation Activity (07)

62.	07-1-1107-1-2018/2027	ADSR. Accelerator driven subcritical reactor M. Paraipan	200
63.	07-5-1131-1-2024/2028	Radiation resistance of materials to high-intensity beams of heavy ions V.A. Skuratov	206
64.	07-5-1131-2-2024/2028	Nanocomposite and functional track etched membranes P.Yu. Apel	207
65.	07-5-1131-3-2025/2029	High-sensitivity sensor based on molecular recognition for viruses detection A.N. Nechaev, E.G. Zavyalova	208

Physics and Technology of Charged Particle Accelerators (08)

66.	08-2-1126-1-2024/2028	Design and development of a test zone for methodological studies of detectors at a linear electron accelerator LINAC-200 in the DLNP M.I. Gostkin	219
67.	08-2-1126-2-2016/2028	Presicion laser metrology for accelerators and detector complexes V.V. Glagolev, M.V. Lyablin	220
68.	08-2-1126-3-2016/2028	Development of experimental techniques and applied research with slow monochromatic positron beams (PAS) A.A. Sidorin	221
69.	08-2-1126-4-2015/2028	Novel semiconductor detectors for fundamental and applied research G.A. Shelkov	221
70.	08-2-1126-5-2011/2028	GDH&SPASCHARM Yu.A. Usov	222
71.	08-2-1127-1-2024/2027	Creation of test benches for testing subsystems of the MSC-230 cyclotron G.A. Karamysheva, S.L. Yakovenko	225
72.	08-2-1127-2-2026/2027	Technological Positron Annihilation Spectroscopy Complex PASTech S.L. Yakovenko	226

Organization of Scientific Activity and International Cooperation.**Strengthening Human Resources. Educational Program (09)**

73.	09-9-1139-1-2021/2028	Open information and educational environment for supporting fundamental and applied multidisciplinary research at JINR Yu.A. Panebrattsev	238
74.	09-3-1117-1-2024/2028	DIAS-TH. Dubna International Advanced School of Theoretical Physics I.G. Pirozhenko, E.A. Kolganova	243

JINR Large Research Infrastructure

NICA Complex

Design and Construction of the Complex of Accelerators, Collider and Physics Experimental Facilities at Extracted and Colliding Ion Beams Aimed at Studying Dense Baryonic Matter and the Spin Structure of Nucleons and Light Ions, and at Carrying out Applied and Innovation Projects

Leaders: V.D. Kekelidze
A.V. Butenko
G.V. Trubnikov

Deputies: V.M. Golovatyuk
M.N. Kapishin

Participating countries and international organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, Chile, China, Cuba, Egypt, Georgia, Germany, Japan, Kazakhstan, Mexico, Moldova, Mongolia, Russia, Serbia, Slovakia, South Africa, USA, Uzbekistan.

The problem under study and the main purpose of the research:

Search and investigation of phase transitions in strongly interacting nuclear matter at extremely high baryon densities, study of the nucleon spin structure, of light nuclei and polarization phenomena in few nucleon systems. Development of theoretical models of the studied processes and theoretical support of the experiments. Development of the Nuclotron accelerator complex as a basic facility for studying relativistic nuclear collisions in the range of atomic masses $A = 1 \div 197$. Investigation of reaction dynamics and studying modifications of hadron properties in nuclear matter, near-threshold strange hyperons production and search for hyper nuclei in interactions of the Nuclotron extracted ion beams with fixed targets at the BM@N detector. Development and stage-by-stage creation of the NICA heavy ion collider accelerator complex, the multi-purpose detector (MPD/NICA) and spin physics detector (SPD/NICA) for experiments with colliding heavy ions beams. Modernization of extraction beam lines and Nuclotron magnetic system. Carrying out of experiments with ion beams and polarized proton and deuteron beams at the Nuclotron. Development of the infrastructure for applied research at NICA heavy ion beams.

Projects of the infrastructure:

Name of the projects	Project leaders	Project code
1. Nuclotron-NICA	A.V. Butenko E.M. Syresin <i>Scientific leader:</i> I.N. Meshkov	02-1-1065-1-2011/2027
2. BM@N	M.N. Kapishin	02-1-1065-2-2012/2031
3. MPD	V.M. Golovatyuk V.D. Kekelidze V.G. Riabov	02-1-1065-3-2011/2030
4. SPD	A.V. Guskov <i>Deputy:</i> V.P. Ladygin	02-1-1065-4-2020/2029

Projects:

Name of the project		Project leaders	Implementation period
Laboratory	Responsible from laboratories		Status
1.	Nuclotron-NICA	A.V. Butenko E.M. Syresin <i>Scientific leader:</i> I.N. Meshkov	2011-2027
			Realization
1.1.	NICA injection complex: technical design preparation and construction of the NICA injection complex: (sources of heavy ions and polarized light nuclei, HILAC linear accelerators of heavy ions and light nuclei of beam transporting to the Nuclotron)	V.A. Lebedev V.A. Monchinsky E.M. Syresin A.V. Tuzikov	Realization
1.1.a.	Commissioning of the heavy ion source (KRION)	E.E. Donets	Realization

1.5. R&D, construction and development of cryogenic systems **N.N. Agapov**
A.V. Konstantinov

Projecting Realization

VBLHEP S.A. Arefiev, M.A. Basheva, D.M. Belov, V.M. Drobin, A.E. Emelyanov, E.F. Filippova, S.P. Gorelikov, S.V. Gudkov, E.V. Ivanov, M.V. Kondratiev, V.A. Kosinov, E.A. Kulikov, D.V. Lobanov, Yu.A. Mitrofanova, L.P. Peshkov, I.M. Petrov, S.A. Smirnov, O.B. Yarovikova

Brief annotation and scientific rationale (NICA):

Development and implementation of works on the existing infrastructure of the VBLHEP accelerator complex: HILAC, Booster, Nuclotron, beam transport channels in bld. 1, bld. 205 and new building 17, along with other systems and new equipment required for the NICA collider commissioning under the project equipment configuration in 2027.

Expected results upon completion of the project:

Commissioning of the NICA complex objects at basic configuration of the collider equipment, prolongation of the experiments at fixed targets with heavy ion and light nuclei polarized beams, start of the experiments with colliding beams, R&D, prototyping, testing, pre-serial magnet production for the "new" Nuclotron ring.

Expected results of the project in the current year:

Experiments with circulating in collider heavy ion beams at the kinetic energy up to 2 GeV/n with internal target and colliding beams.

2.4. Analysis of BM@N experimental data and feasibility studies for BM@N program in heavy ion beams **M.N. Kapishin**
A.I. Zinchenko

Realization

Abstract and scientific rationale (BM@N):

Investigation of reaction dynamics and studying modifications of hadron properties in nuclear matter, near-threshold strange hyperons production and search for hyper nuclei in interactions of the Nuclotron extracted ion beams with fixed targets at the BM@N detector.

Expected results upon completion of the project:

Commissioning of BM@N and obtaining physics results on interactions of Nuclotron extracted ion beams with fixed targets to study reaction dynamics and the equation-of-state of nuclear matter, modifications of hadron properties in nuclear matter, near-threshold strange hyperons production and to search for hyper nuclei.

Expected results in the current year:

Preparing the BM@N set-up for the physics run with a heavy ion beam extracted from the Nuclotron. New data collection with a heavy ion beam at BM@N. Analysis of new experimental data collected at BM@N.

Abstract and scientific rationale (MPD):

The MPD experiment at the NICA collider is designed to study collisions of relativistic heavy nuclei in the energy range = 4-11 GeV. The physical program of the experiment is aimed at studying the structure of the phase diagram of the state of strongly interacting matter in the region of moderate temperatures and large baryon densities exceeding the density in ordinary nuclear matter by 5-8 times. At the same time, much attention is also paid to the issue of searching for parton degrees of freedom and critical signatures in the resulting system using various physical observables. In order to carry out these studies, the detectors of the experimental setup must ensure effective registration and identification of various particles born in collisions of nuclei and measurement of their parameters at high loads in a wide range of phase space.

Expected results upon completion of the project:

Creating and launching the first stage of the MPD experimental.

The configuration of the first stage includes: a magnet that creates a uniform field up to 0.57T, a track system based on the time projection chamber TPC, a time-of-flight detector FFD-TOF, an electromagnetic calorimeter ECal and a forward hadron calorimeter FHCAL.

Holding a technical run with the beams of the NICA collider to configure all subsystems of the MPD experimental setup, holding a physical run with the beam for a set of events corresponding to collisions of heavy ions in the required beam configuration in order to study the properties of baryonic matter.

Creation and commissioning of a centralized monitoring, control and operation system for detectors, magnets, gas system (DCS), as well as an emergency indication and emergency response system.

Development of the DAQ system for the detector subsystems.

Development of a system for continuous monitoring of the quality of data recorded from detectors (QA), calibration of detectors and primary processing of data obtained from the experimental facility to switch from the raw data format to tables of recovered tracks and hits in detector subsystems, processing of the tables of tracks and hits obtained at the previous stage in order to determine the operational characteristics of detectors and the entire facility, as well as obtaining the first physical results.

Expected results of the project in the current year:

The internal schedule of the MPD experimental facility is closely aligned with the collider's operation and launch schedule.

In 2027, a beam run is planned at the NICA collider. At the initial stage, the luminosity of the collider is expected to be relatively low, and the frequency of nucleus collisions of 1-10 Hz will be achieved by the end of the acceleration run. The majority of the experimental data at MPD will be obtained by studying the collisions of one of the collider beams (Xe) with an internal fixed target (W) placed directly in the detector region.

By 2027, the MPD experimental facility is expected to be fully assembled in its baseline Stage 1 configuration and placed into its operational position on the beamline. At the start of the year, full-scale commissioning of the facility will begin, which involves supplying working gas mixtures, as well as low and high voltages to the detectors, along with the integration and commissioning of the control and DAQ systems.

An important task will be to determine the optimal operating parameters and algorithms of the MPD trigger system, which is based on the FFD, FHCAL and TOF detectors. This is necessary for the efficient selection of events corresponding to nucleus collisions both on the fixed target and in collider mode, as well as for the precise determination of the primary vertex coordinates and the start time T₀. The developed algorithms will be implemented at the hardware level, taking into account the actual detector characteristics, the achieved noise levels of the electronics, and the background conditions at the collider.

To optimize the operating parameters of the facility and to enable the subsequent interpretation of the first experimental data, simulations of the MPD performance will be carried out for the Xe+Xe and Xe+W collisions, using various event generators.

Operation of the detector with the beam will require the start of the first Collaboration shifts.

The first data collected with the beam will be used for a detailed study of the detector subsystem characteristics, for calibration of the signal reconstruction algorithms, as well as for track reconstruction of charged particles and their association with the responses of the outer detectors.

4. Construction of the SPD facility for studying spin effects in nuclear interactions

Abstract and scientific rationale (SPD):

The Spin Physics Detector is a planned experimental setup at the NICA collider is intended to study the spin structure of the proton and deuteron and the other spin-related phenomena with polarized proton and deuteron beams at a collision energy up to 27 GeV and a luminosity up to $10^{32} \text{ cm}^{-2} \text{ s}^{-1}$. In the polarized proton-proton collisions, the SPD experiment will cover the kinematic gap between the low-energy measurements at ANKE-COSY and SATURNE and the high-energy measurements at the Relativistic Heavy Ion Collider, as well as the planned fixed-target experiments at the LHC. As for the possibility for NICA to operate with polarized deuteron beams at such energies, it is unique. SPD is planned to operate as a universal facility for comprehensive study of the unpolarized and polarized gluon content of the nucleon at large and moderate x , using different complementary probes such as: charmonia, open charm, and prompt photon production processes. A priority of the experiment is the measurement of parton distributions depending on the transverse momentum of partons in the nucleon (TMD PDFs). The study of spin effects in the elastic scattering of protons and deuterons, and in the production of lambda-hyperons, search for dibaryon resonances, study of the charmed particles production near threshold, study of multiquark correlations, and other polarized and unpolarized physics will be available at the first stage of the collider operation with reduced luminosity and collision energy of proton and ion beams.

Expected results upon completion of the project:

The main result of the experiment should be new information on the gluon helicity, gluon Sivers, Boer-Mulders and other Transverse Momentum Dependent PDFs in the nucleon, as well as the gluon transversity distribution and tensor PDFs in the deuteron, via the measurement of specific single and double spin asymmetries. The results expected to be obtained by SPD will play an important role in the general understanding of the properties of strong interaction, specifically, of the nucleon gluon content and will serve as a complementary input to the ongoing and planned studies at RHIC, and future measurements at the EIC (BNL) and fixed-target facilities at the LHC (CERN). Simultaneous measurement of the same quantities using different processes at the same experimental setup is of key importance for minimization of possible systematic effects.

Expected results of the project in the current year:

Development of components for the SPD facility subsystems for the first stage of the experiment: the Micromegas-based central tracker, the Straw-tube-based tracker, the beam collision counter, the muon system, the endcap part of the electromagnetic calorimeter, the cryogenic system, the superconducting magnet and its yoke, the data acquisition system, as well as the computer infrastructure.

Creation and development of infrastructure for testing prototypes of the SPD subsystems with the Nuclotron beams.

MLIT M.S. Katulin, A.G. Soloviev

Abstract and scientific rationale:

The Baikal-GVD project is aimed at the further development of the gigaton-scale neutrino telescope for studies in multimessenger astronomy, investigations of fundamental properties of the most energetic cosmic neutrinos, indirect search for galactic dark matter, and applied research. The international Baikal-GVD Collaboration is constructing the neutrino telescope in Lake Baikal. The arrays of light-sensitive elements, optical modules, detect the Cherenkov light produced by charged particles in the water while travelling with the speed exceeding the speed of light in water. These particles could originate from interactions of neutrinos in water or in the bedrock. The energy and direction of incoming neutrinos are reconstructed from the amount of Cherenkov photons and time of their detection by single light-sensitive elements. The telescope is capable of investigating cosmic neutrinos and identifying their sources, searching for neutrinos from dark matter annihilation, and other rare phenomena. The scientific programme of the project is focused on solving fundamental problems of astrophysics and elementary particle physics: identification of astrophysical sources of ultrahigh-energy neutrinos, investigation of mechanisms of formation and evolution of galaxies, etc. In particular, one of the short-range goals is mapping the high-energy neutrino sky in the Southern Hemisphere, including the region of the Galactic Centre. Other topics cover the indirect search for dark matter by detecting neutrinos produced in annihilations of weakly interacting massive particles (WIMPs) in the Sun or in the Earth's interior. The Baikal-GVD will also search for exotic particles, such as magnetic monopoles, supersymmetric Q-balls, or nuclearites. The Baikal-GVD, the unique neutrino telescope, is one of the JINR basic facilities.

Expected results upon completion of the project:

Construction of the deep-underwater neutrino telescope of a 1-km³ scale in Lake Baikal. Study of high-energy neutrino fluxes from space, search for hypothetical particles: magnetic monopoles or particles, the candidates for dark matter. Large detection volume, high angular resolution, high energy resolution, and moderate background conditions typical of fresh water ensure efficient studies of the diffusive neutrino flux and the fluxes from individual astrophysical objects with constant and transient luminosity.

Expected results for the project in the current year:

Data taking by 16 already installed clusters of the Baikal-GVD neutrino telescope. Search for and study of high-energy neutrinos of astrophysical origin. Preparation for and deployment of the next detector clusters. Design and testing of a new system of data acquisition and transmission that will reduce the threshold of detectable energies. Development of new technologies for deploying detector elements.

MICC

Multifunctional Information and Computing Complex

Leaders: V.V. Korenkov
S.V. Shmatov

Deputies: A.G. Dolbilov
D.V. Podgainy
T.A. Strizh

Participating countries and international organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, CERN, China, Egypt, France, Georgia, Kazakhstan, Mexico, Mongolia, Russia, South Africa, Uzbekistan.

The problem under study and the main purpose of the research:

The main objective of the MICC is to meet the needs of the JINR scientific community to the maximum extent possible in order to solve urgent tasks, from theoretical research and experimental data processing, storage and analysis to the solution of applied tasks in the field of life sciences. The tasks of the NICA project, the neutrino programme, the tasks of processing data from the experiments at the LHC and other large-scale experiments, as well as support for users of the JINR Laboratories and its Member States will be the priorities.

The Theme presupposes the inclusion of activity, which, like the project, is aimed at meeting the requirements of a large number of research and administrative personnel:

– development of the digital platform "JINR Digital EcoSystem", which integrates existing and future services to support scientific, administrative and social activities, as well as to maintain the engineering and IT infrastructures of the Institute, which in turn will provide reliable and secure access to different types of data and enable a comprehensive analysis of information using modern technologies of Big Data and artificial intelligence.

Abstract and scientific rationale:

To attain the major goals of JINR's flagship projects, it will be required to process a huge amount of experimental data. According to a very rough estimate, these are tens of thousands of processor cores and hundreds of petabytes of experimental data. The experiments of the NICA project and the JINR neutrino programme (Baikal-GVD, JUNO, etc.) entail Tier0, Tier1 and Tier2 grid infrastructures. To achieve these goals, it is essential to develop distributed multi-layer heterogeneous computing environments, including on top of the resources of the participants of other projects and collaborations.

The concept of the development of information technology, scientific computing and Data Science in the JINR Seven-Year Plan provides for the creation of a scientific IT infrastructure that combines a multitude of various technological solutions, trends and methods. The IT infrastructure implies the coordinated development of interconnected IT technologies and computational methods aimed at maximizing the number of JINR strategic tasks to be solved that require intensive data computing. The large research infrastructure project "Multifunctional Information and Computing Complex" holds a special place in this concept.

The MICC main objective for 2024-2030 is to perform a set of actions aimed at the modernization and development of the major hardware and software components of the computing complex, the creation of a state-of-the-art software platform enabling the solution of a wide range of research and applied tasks in accordance with the JINR Seven-Year Plan. The rapid development of information technology and new user requirements stimulate the development of all MICC components and platforms. The MICC computing infrastructure encompasses four advanced software and hardware components, namely, the Tier1 and Tier2 grid sites, the hyperconverged "Govorun" supercomputer, the cloud infrastructure and the distributed multi-layer data storage system. This set of components ensures the uniqueness of the MICC on the world landscape and allows the scientific community of JINR and its Member States to use all progressive computing technologies within one computing complex that provides multifunctionality, scalability, high performance, reliability and availability in 24x7x365 mode with the multi-layer data storage system for different user groups.

Within the MICC, it is provided to support the operation of all MICC hardware and software components, i.e., the Tier1 and Tier2 grid sites, the cloud infrastructure, the hyperconverged "Govorun" supercomputer, the multi-layer data storage system, the network infrastructure, the power supply and climate control systems, as well as to modernize/reconstruct the above components in accordance with new trends in the development of IT technologies and user requirements. In addition, it is required to ensure high-speed telecommunications, a modern local area network infrastructure and a reliable engineering infrastructure that provides guaranteed power supply and air conditioning for the server equipment.

Expected results upon completion of the project:

Modernization of the JINR MICC engineering infrastructure (reconstruction in accordance with modern requirements of the machine hall of the 4th floor of MLIT).

Modernization and development of the distributed computing platform for the NICA project with the involvement of the computing centres of the NICA collaboration.

Creation of a Tier0 grid cluster for the experiments of the NICA megaproject to store experimental and simulated data. Expansion of the performance and storage capacity of the Tier1 and Tier2 grid clusters as data centres for the experiments of the NICA megaproject, the JINR neutrino programme and the experiments at the LHC.

Enlargement of the JINR cloud infrastructure to broaden the range of services provided to users on the basis of containerization technologies. Automation of the deployment of cloud technologies in the JINR Member States' organizations.

Expansion of the HybriLIT heterogeneous platform, including the "Govorun" supercomputer, as a hyperconverged software-defined environment with a hierarchical data storage and processing system.

Design and elaboration of a distributed software-defined high-performance computing platform that combines supercomputer (heterogeneous), grid and cloud technologies for the effective use of novel computing architectures.

Development of a computer infrastructure protection system based on fundamentally new paradigms, including quantum cryptography, neurocognitive principles of data organization and data object interaction, global integration of information systems, universal access to applications, new Internet protocols, virtualization, social networks, mobile device data and geolocation.

Expected results for the project in the current year:

Maintenance and enhancement of the quality and reliability of the JINR external telecommunication channels (4x100 Gbps), the JINR backbone network (2x100 Gbps), the transport network of the NICA megaproject (4x100 Gbps), the MLIT mesh network (100 Gbps), and the Wi-Fi network at the Institute's sites. Continuation of work on organizing computing connection with Chinese centers and other organizations participating in the JUNO, NICA, and other JINR projects.

Provision of technical (DNS, DHCP, etc.) and standard (email, file sharing, security) network services. Maintenance, support, and development of the authorization system, user databases, network elements, etc.

Modernization, maintenance, and operation of machine halls on the 2nd and 4th floors.

Organization of the round-the-clock (24/7) and fault-tolerant operation of the engineering systems of the MICC, including guaranteed power supply systems (distribution boards, uninterruptible power supplies, diesel generators), climate control systems (chillers, dry and wet coolers, inter-row air conditioners), and fire safety systems for MLIT premises. Comprehensive maintenance and regular optimization of engineering equipment to ensure the ultimate efficiency of computing resources. Modernization of the power distribution system of Module 0 and creation of Module 5 for the Tier1 grid site. Conducting a range of works on the installation and commissioning of additional uninterruptible power supplies. Installation of new modules for computing equipment on the 2nd and 4th floors of the MLIT computing halls.

Further development of the computing infrastructure and storage system of the MICC basic components, namely, the Tier1 center, Tier2/CICC, and the EOS-based data lake, including dedicated EOS systems for MPD, SPD, and BM@N. Ensuring the operation of WLCG virtual organizations, the NICA experiments, etc., support for local user groups on the MICC Tier1 and Tier2/CICC resources. Implementation of a central database service for the NICA experiments and the neutrino program. Support for the JINR GRID CA certification center. Preparation of Enstore code for use on OS Alma Linux 10. Generation of service and client distributions, revision of documentation. Implementation and testing of Recommended Access Order (RAO). Organization of user database backups. Analysis of the feasibility of using tape storage managed by CTA and Enstore to organize the storage of NICA experiment data.

Development of the distributed information and computing environment (DICE) of the JINR Member States' organizations, advancement of the management mechanisms of the DICE infrastructure.

Enlargement of the computing infrastructure of the neutrino platform to meet the needs of scientific projects and collaborations, including Baikal-GVD, JUNO, NOvA, TAIGA, etc.

Modernization of the JINR cloud infrastructure, enhancement of monitoring and management tools, expansion of the range of services provided, including Kubernetes-as-a-Service.

Elaboration of software tools for analyzing data storage systems and a methodology for testing the performance of heterogeneous computing resources managed by DIRAC.

Investigation and implementation of technologies for the automation and orchestration of system and cluster software of the HybriLIT heterogeneous platform and the Govorun supercomputer. Performing work on the integration of an InfiniBand network segment into the high-speed computing network (interconnect) of the Govorun supercomputer.

Development of a system for collecting, visualizing, and analyzing statistics on the use of computing resources and software by users of the HybriLIT heterogeneous platform and the Govorun supercomputer, deployed on the Yandex DataLens BI system.

Modernization of the ML/DL/HPC ecosystem and development of software services that provide capabilities for data processing using machine and deep learning methods for applied scientific tasks in spintronics, radiobiological research, etc. Use of ML/DL/HPC ecosystem resources for the enhancement of quantum and hybrid quantum-classical machine learning methods, the elaboration of approaches to increasing the efficiency of parallelizing tasks on hybrid clusters based on quantum computing algorithms, and the development of quantum-like analogs of data analysis methods.

Development of tools and methods for monitoring the MICC engineering and computing infrastructure. Elaboration and modernization of monitoring the MICC engineering infrastructure, power supply and climate control systems. Enhancement of the LITmon monitoring system: introduction of new equipment into the MICC engineering and computing infrastructure

monitoring system; addition of new nodes for the SPD experiment; transition of the monitoring system under the control of the puppet + foreman configuration synchronization system; development of a system for the automatic generation of the LITmon monitoring system configuration; implementation of DCIM support.

Abstract and scientific rationale:

The activity is aimed at the development of the Institute-wide digital platform “JINR Digital Ecosystem”. The main objective is the organization of a digital space with single access and data exchange between electronic systems, as well as the digitalization of significant scientific, technical, and social processes. Based on the digital space being developed, it is planned to create the Institute’s intelligent digital environment that integrates data, services, knowledge bases, scientific, organizational, and technical information. This activity will embrace the transition from individual digital services to digital assistants and elements of digital twins of processes, services, and the infrastructure.

Within the activity, two main directions of work are planned: the development of the basic infrastructure of the digital platform (including for the use of artificial intelligence technologies) and the creation and development of digital services and intelligent assistants. Digital services will be developed and maintained for both JINR staff members and scientific collaborations whose activity is related to the Institute’s basic facilities.

Expected results upon completion of the activity:

Development of the software-hardware and methodological basis for the functioning of the Institute-wide digital platform, services, and intelligent assistants.

Development of AI assistants for scientific activities: search and analysis of scientific and technical information, support of research scenarios, work with data, and acceleration of individual research stages.

Creation of specialized knowledge bases to support the activities of collaborations, research work, and the operation of the engineering infrastructure.

Modernization of the JINR institutional Publications Repository and elaboration of a cognitive platform based on it to support collective scientific activities.

Expected results in the activity in the current year:

Work on supporting and developing the JINR Scientific Publications Repository. Prototyping of the active repository, i.e., pilot implementation of the component of semantic analysis of publications based on a collection of publications affiliated with JINR.

Development of a methodology for the intelligent analysis of scientific and technical information based on natural language processing methods and advanced artificial intelligence technologies, creation of a prototype of a software package for extracting, structuring, and semantically analyzing knowledge from heterogeneous data sources.

Ongoing support and development of the Dubna EDMS, modernization of the system core. Integration of individual functions of the Dubna EDMS into the DES shell. Ongoing support and development of the PIN, Advance Reports, ISSC, CernDB, and NICA EVM systems. Integration of the DES and 1C. Provision of procurement data for the VESNA. Aster document management system.

Implementation of the updated service of expense reports on business trips with the ability to upload electronic originals and copies of documents, optimization of request review processes.

Development of digital collaboration services (scientific documentation database, project management, secure file sharing and collaboration service for documents of various types, etc.).

Creation of a JINR employee's personal account in the DES, allowing for the management of the employee's profile and the information and computing resources and services available to him.

Development of the user support system and the electronic request system for various DES services, preparation of knowledge bases and documentation for users.

Deployment, configuration, and service of access to autonomous specialized generative AI models and tools for interacting with them.

Creation of a platform and development of intelligent digital assistants for various activities of the Institute's subdivisions and scientific collaborations (work with technical information from experiments, DES services, Institute's order database, personnel analytics, geoinformation system).

DRIBs-III

Development of the FLNR Accelerator Complex and Experimental Setups

Leaders: I.V. Kalagin
S.I. Sidorchuk

Deputies: V. A. Semin

Scientific leader: Yu.Ts. Oganessian

Participating countries and international organizations:
China, India, Kazakhstan, Mexico, Russia, Serbia, South Africa, Vietnam.

The problem under study and the main purpose of the research:

The implementation of the DRIBs-III project that includes the upgrade and development of the FLNR cyclotron complex, expansion of the experimental infrastructure of the Laboratory (construction of new physics setups), and the development of accelerator systems. The project is aimed at improving the operation stability of accelerators and at increasing the intensity and improving the quality of ion beams of both stable and radioactive nuclides, while at the same time reducing power consumption. The goal of the project is to significantly improve the efficiency of experiments on the synthesis of superheavy elements and study of their properties.

In addition, the construction of the DC-140 accelerator complex for applied research is planned to be completed and commissioning work will be proceeding. The work is carried out under "The project for the creation of the JINR Innovation Research Center" as a part of "The FLNR research complex for materials science" project.

Within the theme quite as important are the support of physics experiments and the development of existing accelerators and experimental setups.

Projects of the infrastructure:

	Name of the project	Project leaders	Project code
1.	Construction of the U-400R accelerator complex	I.V. Kalagin A.V. Karpov <i>Deputy:</i> V. A. Semin	03-5-1129-1-2024/2028
2.	Development of the experimental setups to study the chemical and physical properties of superheavy elements	S.I. Sidorchuk <i>Deputy:</i> A.M. Rodin	03-5-1129-2-2024/2028

Abstract and scientific rationale:

The goal of the project is the construction of the U-400R accelerator complex for the detailed study of the mechanisms of nuclear reactions with stable heavy-ion beams (fusion–fission, quasifission, multinucleon transfer, etc.), synthesis of new nuclides in these reactions, and decay spectroscopy of nuclei under investigation.

The project encompasses such tasks as the construction of a new experimental hall, the upgrade of the U-400 cyclotron (U-400R following the modernization), and the construction of new separators and ion-guide systems for beam transport.

The accelerator complex will be used for the detailed study of the properties of the isotopes of heavy and superheavy elements and in searches for novel methods of synthesizing heavy nuclides. The studies do not imply the use of radioactive target material in amounts exceeding 10^5Bq .

Expected results upon completion of the project:

Upgrade of the U-400 cyclotron → U-400R.

Construction of a new experimental hall of U-400R.

Construction of new experimental set-ups and beam transport channels from U-400R.

Commissioning of the DC-140 accelerator complex for complex applied research.

Expected results of the project in the current year:

Implementation of the experimental programme at the U-400 cyclotron.

Completion of the construction of the U-400R experimental hall.

Design of the units of the STAR kinematic separator of multinucleon transfer reaction products and preparation for its commissioning.

Development of a design of the SCIF-D set-up for studying nuclear reaction mechanisms.

Development of methods for beam diagnostics of stable and radioactive nuclides.

2. Development of the experimental setups to study the chemical and physical properties of superheavy elements

S.I. Sidorchuk

Deputy:

A.M. Rodin

2024-2028

Manufacture

FLNR N.V. Aksenov, A.A. Astakhov, Y.A. Bolatkazyev, G.A. Bozhikov, E.V. Chernysheva, I. Chuprakov, A.V. Guljaev, A.V. Guljaeva, A. I. Holtzman, D. Ibadullayev, R.K. Kabayeva, A.B. Komarov, N.D. Yu. Vedenev, A.A. Voinov, S.A. Yuhkimchuk

Abstract and scientific rationale:

Nowadays acceleration of high-intensity beams at the DC-280 cyclotron (SHE Factory) provides sufficient statistics in experiments on the synthesis of superheavy nuclei in the vicinity of the island of stability ($Z=114$, $N=184$), thereby opening up new avenues for research. Among the new opportunities the SHE Factory offers are first and foremost studies of the chemical properties of short-lived ($T_{1/2} < 0.5\text{ s}$) isotopes of superheavy elements and precise measurements of their masses.

To carry out experiments on the synthesis of element 119 in the $^{50}\text{Ti}+^{249}\text{Bk}$ reaction, the SHE Factory upgrade project has to be implemented, providing re-equipping of some areas in compliance with Class 1 radiation safety regulations.

The project aims to create novel state-of-the-art experimental instruments. Experimental set-ups to be installed at the DC-280 cyclotron will be used for synthesizing and studying the physical and chemical properties of the isotopes of heavy and superheavy elements as well as in studies of nuclear reaction mechanisms, in nuclear spectrometry and mass spectrometry. To attain these goals, we are planning to construct a new gas-filled GASSOL separator whose key elements are a superconducting solenoid and a multi-reflection time-of-flight mass spectrometer.

Based on a superconducting solenoid magnet, the magnetic gas-filled separator (GASSOL) is intended for studying the physical and chemical properties of superheavy elements, including their short-lived ($T_{1/2} < 0.5\text{ s}$) isotopes, thereby establishing a pathway to elements heavier than Fl. In addition to the efficient separation of reaction products, the separator will focus nuclei of interest into a spot not exceeding 1 cm in diameter.

The specialized high-resolution mass spectrometer is designed for measuring the masses of superheavy elements with $Z=104\text{--}118$ and $A=266\text{--}294$ and their radioactive decay products with an accuracy of <100 keV. Its principle of operation is based on the multi-reflection time-of-flight (MR-ToF) technique.

Expected results upon completion of the project:

Development of methods for producing intensive beams of ^{48}Ca , ^{50}Ti , ^{54}Cr , etc.

Construction of the GASSOL gas-filled separator based on a superconducting solenoid for radiochemical studies of superheavy elements.

Construction of a multi-reflection time-of-flight mass spectrometer.

Expected results of the project in the current year:

Enabling experiments on the synthesis of superheavy elements and study of their properties at the Superheavy Element Factory.

Implementing the SHE Factory upgrade project involving re-equipment of some premises to comply to Class 1 radiation safety regulations.

Making adjustments and launching the superconducting gas-filled GASSOL separator. Installing the GASSOL engineering systems and a beamline transport system from DC-280 to the separator.

Manufacturing the units of the multiple-reflection time-of-flight mass spectrometer. Assembling and adjusting a prototype of the mass filter.

Pulsed Neutron Source and the Complex of Spectrometers

Leaders: E.V. Lychagin
S.A. Kulikov

Participating countries and international organizations:

Argentina, Armenia, Azerbaijan, Belarus, Bulgaria, China, Cuba, Czech Republic, Egypt, France, Germany, Hungary, IAEA, India, Italy, Japan, Kazakhstan, Latvia, Mongolia, Romania, Russia, Serbia, Slovakia, South Africa, Spain, Sweden, Switzerland, Tajikistan, USA, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:

Revealing the relationships between the structural features of materials and their physical properties at the microscopic level is one of the fundamental tasks that determines the development of modern concepts in the field of condensed matter physics, materials science, chemistry, geophysics, engineering, biology and pharmacology. The unique advantages of using neutron research methods make their application the most optimal, and in some cases the only approach for solving a wide range of topical fundamental and applied problems. For the successful implementation of the neutron research program, it is of utmost importance to support and develop large infrastructures, encompassing the neutron source and the suite of spectrometers.

The main objective of the project for the development of the complex of spectrometers is the continuous improvement of experimental techniques available to scientists. This is achieved mainly by increasing the number of controlled parameters, number of detectors, and sample environment systems used in the experiment. Quality is also improved by upgrading them, increasing the requirements for the accuracy and operation speed of data acquisition equipment, and ensuring remote control over spectrometer subsystems and the experiment. The user policy implemented on IBR-2 spectrometers imposes additional requirements for the equipment of the spectrometers, control systems, and data acquisition systems, which should be easy to master and use, have a user-friendly graphical interface and provide access to measurement results via the Internet.

The development of a concept for the new advanced neutron source at JINR is an important task, the successful solution of which is of key importance for the continuation of the neutron research program after the expiration of the IBR-2 service life. As part of this task, work on the development and construction of the new pulsed fast neutron reactor was included in the Seven-Year Plan for the Development of JINR for 2017–2023 and has been being continued in the current Seven-Year Plan for the Development of JINR for 2024–2030. The main stages of developing the concept of the new source include: development of a preliminary scientific program and determination of the composition of the suite of scientific instruments for conducting neutron research, development of technical specifications for the draft and infrastructure projects, justification of the design of the new neutron source, and the implementation of the research and development program. Work on the reactor design also includes computational and experimental research into the dynamics of pulsed reactors, optimization of the design of the main reactor systems, development of fuel and fuel rods based on it, optimization of the configuration of the complex of moderators, and development of prototypes or special test stands.

Abstract and scientific rationale:

Within the framework of the project, it is planned to study the structural features, magnetic ordering, dynamics, physicochemical properties of new promising materials and nanosystems that demonstrate important functional properties, the microscopic mechanisms of which are poorly understood. The list of objects of study includes multiferroic materials, alloys with giant magnetostriction and shape memory effects, low-dimensional and geometrically frustrated magnets exhibiting unusual magnetic states and properties, materials promising for use in compact electric current sources, magnetic layered nanostructures demonstrating various proximity effects, for example, the coexistence of superconducting and magnetically ordered states, organic functional materials with hydrogen bonds, complex fluids and polymers with a wide range of potential technological applications, the structural organization and properties of which can change significantly with changes in concentration and chemical composition, biological nanosystems, including lipid membranes, proteins and their complexes, the study of which makes it possible to understand the biophysical processes occurring in living organisms, the mechanisms of action and transfer of drugs, the causes of various diseases, biohybrid materials, structural materials that are widely used or planned to be used in various industrial and manufacturing sectors. In addition, it is planned to conduct applied studies of texture, residual stresses and internal organization of rocks and minerals, structural materials, objects of natural and cultural heritage, aimed at establishing mechanisms of geophysical processes, formation of defects and stressed areas in industrial products, reconstruction and analysis of ancient technologies, evolution and development of classification of fossil organisms.

Expected results upon completion of the project:

In the process of realization of the scientific program, new experimental results will be obtained in the study of the relationship between the structural features and dynamics of new functional materials and nanosystems and their physical properties at the microscopic level, which are of great importance for the development of modern concepts in the field of condensed matter physics, chemistry, materials science, biophysics, geophysics and the development of advanced technologies in the field of electronics, compact power sources, pharmacology and medicine. During the implementation of the scientific program, theoretical predictions and models will be experimentally tested, and new phenomena and regularities will be revealed.

The implementation of the methodological program will result in the modernization of the available spectrometers and the development and construction of new instruments at IBR-2, which will expand the scope of their application for interdisciplinary scientific research of new functional materials and nanosystems.

Development and construction of basic elements of the BJN spectrometer will be performed.

Expected results of the project in the current year:

Realization of scientific program

Determination of structural parameters and phase states in functional alloys exhibiting magnetostriction and shape memory effects.

Analysis of structural phase transformations and their relationship with dielectric, ferroelectric, and photocatalytic properties in complex substituted silver niobate oxides.

Determination of parameters of the atomic and magnetic structure of quantum magnetic materials over a wide range of thermodynamic conditions (temperature, pressure).

Determination of characteristics of structural and magnetic phase states in functional materials under high pressure, and analysis of their evolution.

Analysis of complex structural and microstructural states in solid electrolytes and electrodes for metal-ion batteries.

Determination of structural characteristics of optical nanomaterials and analysis of structural parameters of luminescent nanoparticles in a glass matrix.

Investigation of phenomena and effects associated with the coexistence of magnetism and superconductivity in layered nanostructures based on transition metals, rare-earth metals and other elements.

Determination of structural characteristics of carbon nanomaterials, including those used as electrode components in lithium-ion batteries.

Analysis of structural features of magnetic nanosystems, including colloidal nanosystems, composites with magnetic nanoparticles, aggregation effects in magnetic fluids, and core-shell magnetic nanostructures.

Determination of the structural characteristics of polymer systems on substrates, surfactant micelles in the bulk and at interfaces, and polymer-surfactant micelle complexes.

Analysis of the structural organization of thin nanocomposite films, including silicate films containing nanoparticles.

Analysis of phase separation phenomena in liquids at solid interfaces.

Analysis of the physical and biological properties of lipid and native membranes, protein interactions, the structure and properties of proteins and membrane-protein complexes, and protein crystallization.

Determination of structural characteristics and investigation of the properties of biohybrid complexes.

Analysis of the structural features and molecular dynamics of organic compounds, including aromatic and aliphatic carboxylic acids and their derivatives.

Determination of internal stresses and microstrains in structural materials, bulk components, and geological objects.

Texture analysis of biological and paleontological specimens, structural materials, rocks, and cultural heritage artifacts.

Analysis of internal structure and 3D reconstruction of cultural and natural heritage objects, as well as industrial materials and products, using neutron radiography and tomography.

Realization of instrument development program for the IBR-2 spectrometers

Modernization of the detector system of the DN-12 diffractometer for studies of microsamples, which is aimed at increasing luminosity and extending the accessible range of high pressures.

Reconstruction of the Epsilon diffractometer to enable texture studies.

Modernization of the REMUR reflectometer to increase luminosity and polarization efficiency, improve background conditions and further develop sample environment systems.

Enhancement of the technical performance and experimental capabilities of the GRAINS multifunctional reflectometer (including development of liquid cells for experiments).

Development of methodology for diffraction studies of macromolecules on the RTD and YuMO instruments.

Development of energy dispersive radiography and tomography methods for cold neutrons on beamline10A of the IBR-2 reactor.

Upgrade of the FSS correlation spectrometer on beamline 13 of IBR-2 and improvement of its technical performance; further development of the correlation RTOF method.

Modernization of the existing IBR-2 spectrometers to improve their technical characteristics, and to replace obsolete or failed components.

Purchase of pyrolytic graphite crystals for a focusing analyzer; development and fabrication of components of the mirror neutron guide of the BJN spectrometer; preparation of design documentation for a biological shielding gallery to house the mirror neutron guide on beamline 2 of the IBR-2 reactor; and preparation of engineering documentation for the fabrication of a secondary spectrometer.

Abstract and scientific rationale:

The subproject is aimed at studying the features of the structure, magnetic ordering, dynamics, physical and chemical properties of novel promising functional and structural materials, complex liquids and polymers, nanosystems, geophysical objects. The explanation of microscopic mechanisms of the formation of their properties is important both for the development of modern concepts in the field of condensed matter physics, materials science, biophysics, chemistry, geophysics, pharmacology, engineering sciences, and new technological applications in energy production, electronics, biology and medicine.

Neutron methods for studying matter (diffraction, small-angle scattering, reflectometry, inelastic scattering, radiography and tomography) provide detailed information about the atomic and magnetic structure and dynamics of materials at the atomic and nanoscale levels. Due to the peculiarities of the interaction of slow neutrons with matter, neutron scattering methods are highly effective in determining the positions of light atoms surrounded by heavy ones, studying the distribution of elements with close atomic numbers, studying isotopic substitution processes and magnetic structures. This provides great advantages when using neutron scattering methods in the study of a wide range of promising functional materials and nanosystems compared to other approaches.

To ensure the solution of the scientific tasks of the project, it is planned to carry out work to ensure the uninterrupted operation, modernization and reconstruction of the existing spectrometers of the IBR-2 reactor, as well as to complete the work on the creation of a new small-angle scattering and imaging spectrometer. Along with neutron methods, complementary methods of X-ray scattering, Raman, atomic force spectroscopy, etc. with the application of additional laboratory equipment, will be used to improve the efficiency of solving the tasks.

Expected results upon completion of the subproject:

The realization of the scientific program is expected to result in obtaining new experimental information, which will be of importance for studying the relationship between the structural features and dynamics of new functional materials and nanosystems and their physical properties at the microscopic level, as well as for developing modern concepts in the field of condensed matter physics, chemistry, materials science, biophysics and geophysics. The obtained results can later be used to develop scientific foundations for the development of advanced technologies in the field of electronics, compact current sources, pharmacology and medicine. During the implementation of the scientific program, theoretical predictions and models will be experimentally tested, and new phenomena and regularities will be revealed.

The implementation of the methodological program will result in the modernization of the available spectrometers and the development and construction of new instruments at IBR-2, which will expand the scope of their application for interdisciplinary scientific research of new functional materials and nanosystems.

1.2. Development of an inelastic neutron scattering spectrometer in inverse geometry BJN (Bajorek-Janik-Natkaniec) at the IBR-2 reactor

E.V. Raksha
E.A. Goremychkin

2021-2028

Realization

FLNP V.I. Bodnarchuk, K.V. Bulatov, A.V. Churakov, A.N. Chernikov, A.B. Eresko, A.A. Kruglov

Abstract and scientific rationale:

An analysis of the state of research in the field of condensed matter dynamics using inelastic neutron scattering (INS) at FLNP has shown that the existing NERA inelastic neutron scattering spectrometer, which some time ago successfully competed with similar facilities in European neutron centers, is now significantly outdated and no longer meets the needs of the user community in the Eastern European region. Therefore, an extremely important task is to upgrade the INS spectrometer in the historically established research area in order to maintain the competitive position of FLNP JINR in the field of neutron spectroscopy among other world neutron centers.

A promising approach is the creation of a new high-luminosity INS spectrometer that will use modern neutron optics and new design solutions to obtain high-resolution results with a good signal-to-background ratio over a wide range of energy transfer and using the smallest possible mass of the sample under study. This approach is proposed to be used to develop and construct a universal inverse geometry INS spectrometer BJN (Bajorek-Janik-Natkaniec). The combination of the high flux of the IBR-2 pulsed neutron source, modern focusing neutron optics, energy analyzers with a very large surface (two analyzers with an area of $\sim 3.3 \text{ m}^2$) will ensure the maximum possible luminosity of the spectrometer being developed, while the gain factor compared to the NERA spectrometer can be up to a factor of 400.

The main range of scientific problems for which the BJN spectrometer will be used, includes:

- investigations of structural phase transitions at the microscopic level;
- study of proton diffusion processes in systems with different types of hydrogen bonds;
- study of the dynamics of protons in molecular crystals in a wide energy-transfer range;
- investigations of associative interactions of chemical particles, including systems with the formation of hydrogen bonds of various types;
- investigations of magnetic dynamics in compounds with $4f$ and $3d$ transition metals.

List of research objects:

- molecular crystals and their phase derivatives;
- pharmaceutical preparations in the bulk form and in the form of "micronized" or "amorphous" powders;
- new biologically active compounds, including nanostructured ones;
- energy storage materials;
- intermetallic compounds of $4f$ and $3d$ transition metals;
- catalysts;
- photonic materials for industrial applications;
- nanocomposite materials.

Expected results upon completion of the subproject:

Development and fabrication of the main components of the BJN spectrometer.

Expected results of the subproject in the current year:

Purchase of pyrolytic graphite crystals for the development of a focusing analyzer.

Development and fabrication of components for a mirror neutron guide.

Development of project documentation for a biological shielding gallery to house the mirror neutron guide on beamline 2 of the IBR-2 reactor.

Development of engineering documentation for the fabrication of a secondary spectrometer.

2. Scientific and methodological research and developments for condensed matter investigations with IBR-2 neutron beams	V.I. Bodnarchuk V.I. Prikhodko	2021-2028
FLNP, DLNP, LIT	see subprojects participants	Realization

Abstract and scientific rationale:

Condensed matter research using neutron scattering is carried out using fairly complex experimental equipment that allows the implementation of various neutron techniques. To obtain results at the level of world standards, it is necessary to constantly improve measurement techniques to ensure control and monitoring of numerous experimental parameters, improve the operation speed and resolution of data acquisition equipment, and control various mechanisms and sample environment systems. The user policy carried out at the IBR-2 spectrometers imposes additional requirements for the equipment of the spectrometers, control systems, and data acquisition systems, which should be easy to master and easy to use, should have convenient graphic interface and provide access to measurement results via the Internet, etc.

Expected results upon completion of the project:

Commissioning of BSD detector at HRFD on beamline 5 of the IBR-2 reactor and obtaining the first experimental results.

Development of a vector magnet based on asymmetric Helmholtz coils, with a temperature control device for low (1.5 K) and ultra-low (down to 0.5 K) temperatures for the REMUR reflectometer.

Installation of a new chopper on beamline 8 of the IBR-2 reactor.

Development and manufacture of position-sensitive neutron counters of various diameters with resistive anodes.

Development of a test stand to test the characteristics of PSDs.

Development of a standard module of a PSD system based on resistive-wire tubes with a cathode diameter of 6 mm.

Development and commissioning of a new detector system for the REMUR spectrometer.

Development and fabrication of direct-beam monitor at the YuMO spectrometer.

Development of the architecture of a multi-gap ^{10}B -PPRC, manufacture of the prototype and study of its characteristics.

Development of a multi-counter system for the inelastic scattering instrument being designed on beamline 2 of IBR-2.

Adjustment and testing of the ASTRA-M detector at the FSD spectrometer.

Development of a new $\pm 90^\circ$ -detector with combined electronic and time focusing, similar to the ASTRA-M detector on the FSD spectrometer.

Development of detector electronics and data acquisition, pre-processing and accumulation systems for new detector systems. Introduction of multichannel digitizers into the measuring systems of IBR-2 spectrometers.

Introduction of PLCs into control systems of spectrometers. Equipping spectrometers with video surveillance systems. Introduction of new measuring devices and controllers at the request of instrument responsible persons. Automation of the vacuum control system on spectrometers NERA, SKAT, FSD, FSS. Automation of the control system of the magnet current source for the DN-12 cryostat. Unification of temperature control and regulation systems used on IBR-2 spectrometers.

Development of a new cryostat for cooling high-pressure chambers at the DN-12 diffractometer.

Development and implementation on the IBR-2 spectrometers of a new version of the Sonix+ software package adapted to work with the event-list data format.

Continuous modernization (in cooperation with LIT) of the FLNP local area network segment.

Simulation of spectrometers and their components for the modernization of existing spectrometers and for the development of new ones.

Routine operation of the robotic high-precision positioning system for radioactive samples, equipped with visual and dose-monitoring functions, as part of the IBR-2 reactor irradiation facility for radiation resistance studies.

Ensuring the smooth and continuous operation of systems and mechanisms across all spectrometers at the IBR-2 reactor.

Expected results of the project in the current year:

Assembly of the REMUR cryostat: commissioning of the ^4He liquefier column; achievement of a temperature of 0.95 K via a cascade scheme in the ^3He - ^4He dilution-refrigerator column by vacuum pumping of liquid ^4He .

Fabrication of four vector-magnet coils. Cooling of each coil to 10 K to achieve the superconducting state of the winding.

Assembly of all coils onto the vector-magnet frame.

Cooling of the entire assembly to 15 K.

Achievement of the superconducting state of the coil windings within the frame assembly.

Development, fabrication, and testing of a new 8-counter PSD module based on resistive-wire tubes. Development and fabrication of new analog electronics for the module. Development of FPGA firmware for the digitizer as part of the data acquisition system.

Adjustment and calibration of the detector system for the SKAT spectrometer.

Completion of the development of the ASTRA-2M detector with 90-degree geometry for the FSS spectrometer, including detector and data-acquisition electronics. Completion of assembly of the scintillation planes and fabrication of the detector housings. Installation and assembly of detector components. Development, fabrication, and commissioning of detector and data-acquisition electronics.

Adjustment and tuning of analog electronics and data-acquisition system for the 132-channel detector based on ³He counters for the DN-12 spectrometer, followed by testing of the acquisition system on a neutron beam.

Implementation of digitizers in the measurement systems of the IBR-2 spectrometers (FSD, FSS, and HRFD).

Development of infrastructure for development and fabrication of neutron detectors.

Commissioning of new measurement devices and controllers upon requests from instrument-responsible personnel.

Further development of the Sonix+ software package for connecting new instruments, DAQ controllers, and sample environment devices in accordance with user requests.

Development and implementation on the IBR-2 spectrometers of a Sonix+ software package version adapted for handling event-list data, in coordination with users.

Integration of the Sonix+ package with DIDEN and Romana software for detector control on the FSD, HRFD, and YuMO instruments.

Development of a new version of the software for the centralized measurement-data repository. Connection of the YuMO spectrometer to the repository.

Continuous and timely maintenance of the FLNP local area network segment and its modernization in accordance with the the plans of the Laboratory of Information Technologies, as well as maintenance of the FLNP Central Computing Complex.

Development of the Sonix+ software package for connecting new systems, DAQ controllers and sample environment devices according to user requests.

Development of a high-precision system for moving the instrument to the IBR-2 reactor; manufacture of an automated radioactive-sample storage system in accordance with the developed design documentation. Investigation of the radiation resistance of materials using the radiation research facility at the IBR-2 reactor.

Name of the subprojects		Subproject leaders	Implementation period
Laboratory		Responsible from laboratories	Status
2.1. Vector magnet for investigations with polarized neutrons		A.N. Chernikov	2024-2028
			Realization
FLNP	A.V. Altynov, V.I. Bodnarchuk, A.P. Buzdavin, F.A. Chervyakov, U.D. Lusina, I.A. Morkovnikov, T.L. Pikelner, T.B. Petukhova, V.V. Sadilov, N.D. Zernin, V.D. Zhaketov		

Abstract and scientific rationale:

Polarized neutron reflectometry is an experimental method for studying low-dimensional metallic heterostructures, polymer films, biological systems, free liquid surfaces, and magnetic fluids. This method requires specialized equipment, including a dedicated magnetic system. The magnetic system under development—a vector magnet—will enable the direction of the magnetic field to be controlled in two directions and will feature an aperture large enough to house a low- and ultra-low-temperature thermostat, as well as a neutron and gamma-ray detection system. The vector magnet will be installed on the REMUR reflectometer at beamline 8 of the IBR-2 reactor.

Expected results upon completion of the subproject:

Development of a vector magnet based on asymmetric Helmholtz coils, featuring a temperature-control system for low (1.5 K) and ultra-low (down to 0.5 K) temperatures, for the REMUR reflectometer.

Expected results of the subproject in the current year:

Assembly of a cryostat for the REMUR reflectometer: commissioning of the ⁴He liquefier column; reaching 0.95 K via a cascade configuration in the ³He-⁴He dilution refrigerator column by pumping on liquid ⁴He.

Fabrication of four vector magnet coils. Cooling each coil to a temperature of 10 K to transition the winding into the superconducting state.

Assembly of all coils on the vector magnet frame.

Cooling the entire assembly to a temperature of 15 K.

Achieving the superconducting state of the coil windings in the frame-mounted assembly.

2.2. Design and development of infrastructure elements for spectrometers at the IBR-2 reactor		V.I. Bodnarchuk V.I. Prikhodko M.V. Bulavin	2024-2028

Abstract and scientific rationale:

The IBR-2 reactor is a unique neutron source, which is used to study the structure and physical properties of condensed matter. Information about objects under study is obtained using specialized neutron scattering instruments (spectrometers) by applying various research techniques. The quality of the information obtained is determined to a considerable extent by the properties of the neutron source and the quality of experimental equipment. The IBR-2 is a pulsed reactor belonging to the class of high-flux neutron sources, with a pulsed power exceeding 1 MW. The key requirement for the equipment of the scientific instruments is to use the thermal- and cold-neutron flux as efficiently as possible within the framework of the implemented experimental technique. The equipment of any spectrometer is highly diverse and includes neutron-beam-forming components; systems for detecting neutrons and other types of radiation; various systems for monitoring and controlling the experiment; specialized equipment for creating the required sample conditions during measurements; and other components. At the same time, all components and mechanisms must perform their functions under conditions of increased radiation exposure and ensure uninterrupted operation over extended periods. Each spectrometer is a unique facility, even when the same technique is implemented at the same neutron source. Although the equipment of an instrument includes a number of standard components, their configuration is always unique and requires a specialized approach.

This subproject is aimed at designing and developing reliable and efficient spectrometer components to comprehensively support experimental work and obtain high-quality scientific results.

The SC Department has accumulated extensive experience in the development and operation of spectrometer equipment and control systems. It also has highly qualified personnel, which undoubtedly enables the implementation of this subproject aimed at further improving the experimental infrastructure of the IBR-2 reactor. The project consists of seven sections, each representing a separate element of the experimental infrastructure.

Expected results upon completion of the subproject:

Installation and commissioning of a new chopper on beamline 8 of the IBR-2 reactor.

Implementation of PLC-based vacuum-control systems.

Development and manufacture of position-sensitive neutron counters with resistive anodes of various diameters.

Development of a test stand to test the characteristics of PSDs.

Development of a data acquisition system based on multichannel digitizers.

Development of a standard PSD module based on resistive-wire tubes with a 6-mm cathode diameter.

Development and putting into operation of a new detector system for the REMUR spectrometer.

Development and commissioning of an incident-beam intensity monitor for the YuMO spectrometer.

Development of a multigap parallel-plate resistive chamber architecture with a ¹⁰B converter, fabrication of a prototype, and investigation of its characteristics.

Development of a multi-counter system for the inelastic scattering instrument under construction on beamline 2 of the IBR-2 reactor.

Adjustment, testing, and commissioning of the ASTRA-M detector on the FSD spectrometer.

Development of a new $\pm 90^\circ$ space- and time-focusing detector for the FSS diffractometer, analogous to the ASTRA-M detector, complete with detector electronics and data-acquisition and storage electronics.

Development of detector electronics and data acquisition, preprocessing, and storage systems for new detector setups. Integration of CAEN digitizers into the measurement systems of the IBR-2 spectrometers.

Introduction of multichannel digitizers into the measuring systems of the IBR-2 spectrometers.

Implementation of PLCs into spectrometer control systems. Equipping spectrometers with video-surveillance systems. Commissioning of new measuring devices and controllers upon requests from instrument-responsible staff. Automation of vacuum control systems for the NERA, SKAT, FSD, and FSS spectrometers. Automation of the magnet power supply control system for the DN-12 cryostat. Standardization of temperature monitoring and regulation systems used on the IBR-2 spectrometers.

Development of a new cryostat for cooling high-pressure cells at the DN-12 diffractometer.

Modeling of instruments and their components for upgrading existing spectrometers and designing new ones.

Development and implementation of a Sonix+ software version adapted for event-list data on the IBR-2 spectrometers, in consultation with users.

Integration of the Sonix+ package with DIDEN and Romana software for detector control on the FSD, HRFD, and YuMO instruments.

Development of a new version of the software for the centralized measurement-data repository. Connection of the YuMO spectrometer to the repository.

Ongoing and timely support for the FLNP local area network segment, including its modernization in line with the plans of the LIT, as well as maintenance of the FLNP Central Computing Complex.

Routine operation of the precision-positioning system for moving the irradiation facility to the IBR-2 reactor. Commissioning of an automated radioactive-sample storage facility on beamline 3 of the IBR-2 reactor in accordance with the developed design documentation. Investigation of the radiation resistance of materials using the irradiation facility for radiation studies at the IBR-2 reactor.

Ensuring the smooth and continuous operation of systems and mechanisms across all spectrometers at the IBR-2 reactor.

Expected results of the subproject in the current year:

Development, fabrication, and testing of a new 8-counter PSD module based on resistive-wire tubes. Development and fabrication of new analog electronics for the module. Development of FPGA firmware for the digitizer as part of the data acquisition system.

Adjustment and calibration of the detector system for the SKAT spectrometer.

Completion of the development of the ASTRA-2M detector with 90-degree geometry for the FSS spectrometer, including detector and data-acquisition electronics. Completion of assembly of the scintillation planes and fabrication of the detector housings. Installation and assembly of the detector components. Development, fabrication, adjustment and tuning of the detector and data-acquisition electronics.

Adjustment of the analog electronics and data-acquisition system for the 132-channel detector based on ^3He counters for the DN-12 spectrometer. Testing of the data-acquisition system on a neutron beam.

Implementation of digitizers in the measurement systems of the IBR-2 spectrometers (FSD, FSS, and HRFD).

Development of infrastructure for development and fabrication of neutron detectors.

Commissioning of new measurement devices and controllers upon requests from instrument-responsible personnel.

Update of the Sonix+ software package based on Python 3.12 and its implementation on the IBR-2 spectrometers.

Integration of the Sonix+ package with DIDEN and Romana software for detector control on the FSD, HRFD, and YuMO instruments.

Development of a new version of the software for the centralized measurement-data repository. Connection of the YuMO spectrometer to the repository.

Further development of the Sonix+ software package for connecting new instruments, DAQ controllers, and sample-environment devices in accordance with user requirements.

Development and implementation on the IBR-2 spectrometers of a new version of the Sonix+ software package adapted to work with the event list data.

Ongoing and timely maintenance of the FLNP local area network segment and its modernization in accordance with the LIT plans, as well as maintenance of the FLNP Central Computing Complex.

Development of a high-precision system for moving the instrument to the IBR-2 reactor; manufacture of an automated radioactive-sample storage system in accordance with the developed design documentation. Investigation of the radiation resistance of materials using the radiation research facility at the IBR-2 reactor.

3. New advanced neutron source at JINR	E.V. Lychagin V.N. Shvetsov M.V. Bulavin	2021-2028
		Realization

FLNP see subproject participants

Abstract and scientific rationale:

According to Article 4 of the JINR Charter, one of the main areas of research at the Institute is condensed matter physics using nuclear physics methods. The main instrument for this research at the Institute is the neutron beamlines of the IBR-2M reactor at FLNP.

Despite the rapid development in recent decades of various experimental methods for studying the condensed state of matter, neutrons remain in a number of cases the only research probe due to their high sensitivity to light elements, isotopic composition, sensitivity to magnetic fields and high penetrating power. In FLNP JINR, tremendous experience has been accumulated in using neutron beamline instruments of unique pulsed reactors of several generations: IBR, IBR-30, IBR-2, IBR-2M. The state-of-the-art suite of instruments of the IBR-2M reactor makes it possible to conduct applied and fundamental research using almost all neutron scattering techniques. This suite and the user access policy in the form of the User Program are a center of attraction for a large number of researchers from JINR Member States and partner countries.

The main neutron source IBR-2M, currently operating at JINR, is a unique facility that has no analogues in the world, the development and construction of which is one of the most striking achievements of JINR. The expected service life of the reactor (taking into account the possibility of replacing the fuel, extending the license) ends in the early 1940s. Based on this, one of the most important tasks of the Institute is to develop a project for an advanced neutron source that should replace the IBR-2M reactor and could be constructed by the mid-1940s.

Today, the competitiveness of neutrons as a research tool is largely determined by the time required to perform measurements, the accuracy of determining the measured parameters (both spatial and energy), and the minimum and maximum sizes of samples available for research. These possibilities are determined by both the quality of the neutron source itself and the quality of the beamline instruments. Accordingly, one of the main parameters determining the prospects of the source is the achievable neutron flux on the samples under study. The project "New Advanced Neutron Source at JINR" is aimed at developing such a source. Within the framework of the project, the type and parameters of the source, the number and type of moderators, the schemes of optical systems for neutron beamlines, as well as the list of necessary instruments should be determined based on the areas of advanced research with neutrons.

Since 2016, the development of the project for a new advanced neutron source has been underway at FLNP JINR. Taking into account the development trends of high-intensity sources in the world, the current market situation and the extensive experience of the Frank Laboratory of Neutron Physics, it was decided that the new source at JINR should be a pulsed one. Various options were considered: a source based on a proton accelerator with a non-multiplying target, with a multiplying target and mechanical modulation of the multiplication factor (superbooster), various options for a pulsed reactor.

As a result, the work on the development of the new pulsed reactor NEPTUN was included in the seven-year plan for the long-term development of JINR for 2024-2030 as a subproject of the project for the development and construction of the new advanced neutron source at JINR. The concept of the NEPTUN pulsed fast reactor with neptunium nitride fuel was selected based on the results of work carried out in the previous seven-year period, and supported and approved at the 51st meeting of the PAC for CMR in January 2020 for further elaboration.

In 2025, based on the results obtained during the design process, the General Designer, JSC NIKIET, was tasked with developing an alternative concept for a pulsed reactor with high user-oriented performance characteristics that could be constructed within a relatively short period of 15 years.

In 2025-2026, JSC NIKIET presented the results of the research project "Conceptual proposal for an advanced pulsed reactor with plutonium dioxide-based fuel." These results demonstrate that a new pulsed reactor design, closely resembling the IBR-2M reactor, would not provide a significant improvement in the user-oriented performance characteristics of the neutron source. In this design, any further increase in neutron flux density could only be achieved by increasing the reactor power and would therefore be limited by the thermal load on the fuel elements.

At the next stage of developing the conceptual proposal for the advanced pulsed reactor in 2026-2027, JSC NIKIET, in cooperation with JINR, will focus primarily on: developing the core configuration; arranging the control and safety system (CSS) elements, reflector, thermal and cold moderator systems, mechanical neutron-beam choppers, and experimental beamlines within the biological shield; performing neutron-physical and thermal-hydraulic assessments to substantiate the adopted design decisions; and determining the thermal-neutron flux density at the outer surface of the water moderator and comparing it with the corresponding value obtained for the IBR-2M reactor.

Expected results upon completion of the project:

Development of the scientific program and the concept of the suite of instruments for conducting scientific and applied research at the new neutron source.

Determination of the type of the source and its parameters.

Obtaining the necessary initial data for developing the preliminary design of the source and the design of the necessary infrastructure.

Estimation of the cost of the project implementation.

Selection of optimal materials for use as cryogenic moderators at the new neutron source. Selection of a technology for developing a cryogenic moderator system at the new neutron source depending on the moderator material selected.

Expected results of the project in the current year:

Analysis of source types/variants and design options for further development, taking into account the options considered to date.

Comparison of the efficiency of different hydrogen-containing moderators with different geometries. Comparison of the performance of various hydrogen-containing moderators with different geometries.

Completion of R&D aimed at developing a prototype installation for implementing the technology of producing solidified frozen hydrocarbon pellets for use as cryogenic moderators in the new advanced neutron source.

Proposal for the arrangement of the source beamlines and the instrument-suite concept.
 Development of a software-verification scheme for the pulsed reactor.

3.1. Research and development for the justification of the draft design of the new advanced neutron source at JINR — NEPTUN pulsed fast reactor	E.V. Lychagin V.N. Shvetsov M.V. Bulavin	2024-2028
		Realization

FLNP M.V. Avdeev, V.V. Aksenov, A.M. Balagurov, V.I. Bodnarchuk, G.D. Bokuchava, K.V. Bulatov, O.E. Chepurchenko, T.S. Dikova, A.I. Frank, D.S. Grozdov, A.A. Hassan, C. Hramco, S.E. Kichanov, Yu.N. Kopach, D.P. Kozlenko, N. Kučerka, A.I. Kuklin, S.A. Kulikov, I.V. Kushnir, E.E. Perepelkin, M.M. Podlesnyy, A.D. Rogov, E.P. Shabalin, A.E. Verkhoglyadov, Ya.A. Vdovin, A.V. Vinogradov, I. Zinicovscaia

Abstract and scientific rationale:

The main stages of work on the development and construction of the new reactor include: justification of the design of the new neutron source, development of technical specifications for the draft and infrastructure projects, as well as the implementation of an R&D program that includes a computational and experimental study of the dynamics of pulsed reactors, optimization of the design of the main reactor systems, development of fuel and fuel rods based on it, optimization of the configuration of the complex of moderators, development of prototypes or special test stands (for example, an experimental test stand or a prototype of a reactivity modulator, a prototype of experimental fuel rods, test stand for a mesitylene-based cryogenic moderator with a system for fast change of the working material, etc.).

In accordance with the roadmap of the NEPTUN project, the next major stage after the completion of the stages of conceptual design and development of a technical proposal is a draft design. A draft design is developed to determine the principal (constructive, schematic, etc.) solutions for the product, giving a general idea of the working principle and (or) the design of the product. On the basis of the draft design, a justification for investments is developed, which is an obligatory document in the development of such a complex facility as a research reactor (Decree of the Government of the Russian Federation №306 of 14.03.1997).

At the draft design stage, the development and selection of the main technical solutions, the study of structural and functional schemes of the product, the selection of basic structural elements, etc. are carried out. As a rule, at this stage, one or two variants of the reactor are considered from among those recognized as feasible at the conceptual design stage.

The choice of a specific core configuration option is the most important moment and the key point of the entire project of construction of the NEPTUN reactor. This is due to the fact that the technical solutions fixed in the draft design, further at the next stages (technical design, preparation of working design documentation), being included in the voluminous design documentation, can only be changed with great difficulty. Therefore, already before the draft design stage, a thorough study of all controversial and ambiguous points is required, as well as R&D and calculations (kinematic, electrical, thermal, etc.) that confirm the operability and reliability of the product in all specified operating conditions.

The main objective of the subproject is to conduct research and development work to justify the development of the draft design of the NEPTUN reactor. These R&D include: development of neptunium-nitride fuel and neptunium-nitride-based fuel rods; study of dynamics of the pulsed reactor; optimization of the design of the reactivity modulator and the reactor vessel in terms of reducing thermal loads and shape changing; development and implementation of a list of R&D to justify the development of the draft design.

The work carried out jointly with JSC NIKIET from 2020 to 2023 represents a serious research and development and experimental design study of the concept of the NEPTUN reactor, however, the issues and problems that have arisen, primarily regarding the determination of the power threshold for reactor stability, concerning the layout of the core, technical solutions in the design of the reactor vessel and the reactivity modulator, do not yet allow us to proceed to the draft design stage.

The results of the work in 2021-2024 showed that, firstly, the configuration of the core has a stronger impact on the threshold of power stability of the pulsed reactor than previously thought, and secondly, the amount of R&D work required to implement the concept under consideration based on neptunium nitride fuel leads to a long period for the development and construction of the new reactor, significantly exceeding the potential service life of the existing IBR-2M reactor (early 1940s).

In this context, in 2025, the main efforts were focused on studying the mechanisms for the formation of power feedback in pulsed reactors, developing mathematical models describing the processes leading to pulse energy fluctuations, including taking into account the operating experience of the IBR-2 and IBR-2M reactors.

Expected results upon completion of the subproject:

Development of a computer model describing the phenomenon of vibrational instability of a pulsed reactor, including neutron-physical, thermohydraulic and thermomechanical calculation modules.

Determination of the reactor core configuration.

Justification of technical solutions for the design of the vessel and reactivity modulator with permissible thermal loading and temperature deformations.

Development of a list of R&D necessary to justify the design of the reactivity modulator, its components and the reactor vessel.

Determination of the maximum power of the reactor, taking into account the permissible fluctuations and temperature deformations of its components of the core, vessel and modulator.

Expected results of the subproject in the current year:

A concept for a pulsed reactor based on plutonium fuel with specified performance characteristics (in accordance with the agreement between JINR and NIKIET) has been proposed. If the concept proves successful, work should begin on developing the corresponding technical proposal.

Optimization of the configuration of stationary reflectors around the moderators to increase the surface brightness of the moderators, taking into account the limitations on the spatial placement of multi-channel neutron beam extraction systems.

Optimization of the reactivity modulator design to achieve acceptable temperature fields and deformations.

Determination of the optimal configuration of the NEPTUN reactor core in terms of vibrational stability and technical feasibility.

Theoretical Physics (01)

Fundamental Interactions of Fields and Particles

Theme leaders: D.I. Kazakov
O.V. Teryaev

Participating countries and international organizations:

Belarus, Bulgaria, Canada, Chile, China, Croatia, France, Germany, India, Iran, Italy, Poland, Portugal, Russia, Serbia, Slovakia, Spain, Sweden, United Kingdom, USA, Vietnam.

The problem under study and the main purpose of the research:

The main current problems of the modern theory of fundamental interactions are the development of methods of quantum field theory, their application to the description of elementary particle physics within the Standard Model and beyond, theoretical support for existing and planned experiments. Within the framework of the Standard Model, efforts will be focused on the development of multiloop computing methods and their applications to processes at the Large Hadron Collider, the development of new approaches to hadron physics, including heavy quark physics. In physics beyond the Standard Model, the search for Dark matter, manifestations of supersymmetry and other possible new physical phenomena are of particular interest. Theoretical support for the search for new physics in accelerator experiments will be combined with research and analysis of astrophysical data.

Developments in neutrino physics, including the field-theoretic description of neutrino oscillations and the processes of neutrino-nucleon interactions with nuclear matter, in particular in connection with the Baikal-GVD experiment, will remain under constant concern. Special attention will be paid to the theoretical support of the key elements of the JINR experimental program. By studying QCD methods, various approaches to the description of the structure of hadrons and quark-gluon matter under the specific conditions of the NICA complex will be developed and applied.

Laboratory Responsible from laboratories		
1. Quantum Field Theory and physics beyond the Standard Model	D.I. Kazakov A.V. Bednyakov	2024-2028

BLTP A.N. Baushev, A.T. Borlakov, Ch.R. Das, D.A. Evdokimov, A.D. Golovin, N.A. Gramotkov, V.A. Filippov, R.M. Iakhibbaev, A.V. Kotikov, G.A. Kozlov, A.I. Mukhaeva, A.V. Nesterenko, A.I. Onishchenko, M.V. Savina, O.P. Solovtsova, D.M. Tolkachev, A.V. Trenogin, D.A. Volkova

Abstract and scientific rationale:

Quantum Field Theory (QFT) is a widely recognized "language" used to describe the properties of elementary particles and their interactions. It is well known that the triumph of the Standard Model (SM) of particle physics would have been impossible without comparing experimental data obtained from accelerators such as LEP (CERN), HERA (DESY), Tevatron (Fermilab), and LHC (CERN) with high-precision calculations performed using QFT methods. Many years have passed since the construction of the SM, and all these years scientists were searching for New Physics. The problem of dark matter in the Universe is an obvious argument for such searches. The main aim of the Project is to develop the quantum field formalism of gauge and supersymmetric theories, as well as to construct and study particle physics models beyond the Standard Model. In the context of the Project, it is planned to use existing experience and new ideas to investigate a wide range of problems related to high-precision calculations within and beyond perturbation theory as well as to the nature of possible New Physics. Special attention will also be paid to issues that arise at the intersection of particle physics, astrophysics, and cosmology.

Expected results upon completion of the project:

Improved estimate of the contribution from hadronic vacuum polarization to the anomalous magnetic moment of the muon.

Investigation of the shapes of higher twist contributions in deep inelastic scattering with the resummation of large threshold logarithms.

Calculation of two-loop diagrams that arise in non-relativistic QED using the effective mass method and investigation of the completeness of basis functions for elliptic polylogarithms.

Development of a new specialized computer package for the epsilon expansion of generalized hypergeometric functions with one or more variables, whose indices depend on the dimensional regularization parameter, as well as for the numerical calculation of the resulting functions.

Explicit analytical calculation of multi-point master integrals using differential equations.

Calculation of two-loop contributions to electron-muon scattering and quarkonia production.

Calculation of the double spectral density in the problem of sum rules for B-anti-B mixing, which is an important experimental quantity that imposes strict constraints on possible new physics.

Calculation of three-loop massive form factors and polarization operators in QCD.

Calculation of multi-loop amplitudes and form factors with a large number of kinematic invariants in theories with extended supersymmetry.

Derivation of systematic solutions to quantum spectral curve equations in the case of maximally supersymmetric Yang-Mills theory in four dimensions and ABJM theory in three dimensions, both in the weak and strong coupling limits.

Calculation of spectra, correlation functions, and amplitudes in a number of six-dimensional "fishnet" models.

Application of the large charge expansion method to gauge theories and analysis of the resulting implications in both particle physics and condensed matter theory.

Investigation of the scheme dependence of a previously proposed self-consistent subtraction procedure for non-renormalizable theories.

Calculation of effective potentials for a range of theories of modified gravity and their application to analyze various inflationary models.

Investigation of the theory and phenomenology of scalar and vector bosonic stars.

Detailed cosmological and astrophysical analysis of the properties of primary black holes and their connection to the dark matter problem and observable supermassive black holes.

Analysis of the prospects for experimental detection of additional Abelian gauge symmetries and an extended Higgs sector in a range of new physics models. Investigation of the so-called supersymmetric extensions of the Standard Model.

Physical analysis of LHC data aimed at detecting manifestations of the "dark sector" in events where either a Higgs boson or a Z boson is produced, accompanied by a significant fraction missing "transverse" energy (MET), presumably carried away by a messenger particle that ultimately decays into DM particles. The expected outcome is new anomalies in the experimental data (in the fortunate event – the discovery of New Physics), or, in the absence of such signals, new unique constraints on the model parameter space for the considered scenarios of dark matter and Higgs sector.

Development of new (using neural networks for global scanning) as well as optimization and improvement of existing software for modeling physical processes beyond the Standard Model.

Expected results of the project in the current year:

Updated evaluation of the hadronic vacuum polarization contribution to the muon anomalous magnetic moment within dispersively-improved perturbation theory.

Derivation of explicit analytical expressions for the contributions to the anomalous magnetic moments of charged leptons, which are associated with the vacuum polarization due to the n identical lepton loops in high orders of expansion in electromagnetic coupling.

Monodromy study of multi-variable hypergeometric functions with the use of the Mellin-Barnes representation, twisted cohomologies and D-modules.

Analytical computation of spectral density for the three-loop massive photon polarization operator in QCD.

Investigation of the shapes of higher-twist contributions to deep inelastic scattering in the first four orders of perturbation theory taking into account the resummation of large threshold logarithms.

Calculation of multi-loop sunsets in all orders of perturbation theory using the effective mass method.

Perturbative computation of the leading- n contributions to the anomalous dimensions of a class of neutral operators $(\phi^2)^n$ in scalar four-dimensional theories.

Eight-loop renormalization-group calculations in the scalar ϕ^6 model.

Investigation of the low-energy effective behaviour of supersymmetric models, including those that are non-renormalizable in various dimensions.

Computation of radiative corrections to the supersymmetric generalization of the four-fermion interaction model.

Calculation of multi-loop anomalous chiral contributions to the effective potential within the superfield formalism in supersymmetric gauge models.

Extension of the developed method of summation of ultraviolet divergences to effective theories of gravity, aiming at the analysis of high-energy behaviour of gravitational amplitudes and investigation of their relation to asymptotic safety programmes.

Application of the linearization method of the renormalization group equation in renormalizable models of elementary particle physics.

Investigation of the contrast differences between the production of the hypothetical pseudoscalar A-Higgs boson and the pseudoscalar heavy hadron (the bound state) composed of a top quark and an anti-top quark, the “toponium”, taking into account the LHC data collected in 2025-2026.

Phenomenological analysis of dark matter manifestations in several SM extensions with axion-like particles.

Fixing the renormalization scheme in subleading quantum corrections to an arbitrary effective potential in inflationary cosmological models.

Study of the properties of cosmological perturbations and an investigation whether dark matter perturbations could collapse to form supermassive black holes during the reionization of the Universe.

Derivation of a formula for the density profile of the central part of the cosmological void, analysis of the void distribution in parameter space, and comparison of the theoretical predictions with numerical data.

Investigation of multi-messenger signals from bright and dark sirens for the resolution of Hubble- constant tension.

Development of an effective dark energy model containing the evolving scalar degrees of freedom which may play the role of a quintessence, one of the candidates to dynamical dark energy.

Analysis of the influence of dark energy on the velocity field of nearby galaxies in the case when dark energy is quintessential, i.e., its density is variable. Comparison of the obtained results with observations.

Investigation of compact cosmological objects and formation of inhomogeneities in modern inflationary Universe in the model with topological line defects – the string like tubes.

2. QCD and hadron structure

I.V. Anikin
S.V. Mikhailov
O.V. Teryaev

2024-2028

BLTP Yu.A. Anikin, V.V. Bytiev, S.V. Goloskokov, A.G. Grozin, A.L. Kataev, R.V. Khakimov, N.V. Krasnikov, A.G. Oganessian, A.A. Pivovarov, G.Yu. Prokhorov, V.A. Saleev, A.A. Sazonov, O.V. Selyugin, D.A. Shohonov, A.Ya. Silenko, D. Strozik-Kotlorz, N.I. Volchanskiy, V.I. Zakharov, A.S. Zhevlakov

Abstract and scientific rationale:

Lacking a complete theoretical understanding of the color confinement, the only method of applying QCD is based on the factorization of the short-distance (perturbative) and long-distance (nonperturbative) dynamics. The conventional systematic way of dealing with the long-distance part is to parametrize it in terms of matrix elements of quark and gluon operators between hadronic states generating GPDs, DAs, TMDs, etc. These matrix elements have to be either extracted from experiment or determined on the lattice. In many phenomenological applications they are usually modeled in terms of various nonperturbative methods or models. The main objective of the project is to develop comprehensive theoretical frameworks to study the multi-dimensional partonic content of hadrons by combining various approaches based on the factorization theorem and starting from the first principles of QCD.

For many years, theoretical and experimental studies of the nucleon structure have been restricted to a one-dimensional picture along a light-cone direction. Within this one dimensional picture, quark and gluon contents of the nucleus are described by the parton distribution functions (PDFs) which depend on the longitudinal momentum of the parton inside the hadron.

The last decade has witnessed a tremendous effort to go beyond this one-dimensional description of the nucleon. Recent improvements in experimental facilities such as increased electron beam luminosities and polarization degrees, detector resolution and coverage, and advanced theoretical computation frameworks, such as calculating radiative and power corrections to complementary sets of observables, provide a breakthrough for investigating the multi-dimensional partonic content of the nucleon, which is also referred to as hadron tomography. In this respect, the multi-dimensional parton distribution functions such as transverse-momentum-dependent distribution functions (TMDs) or generalized parton distribution functions (GPDs) have been the key subjects of both experimental and theoretical studies.

With the advent of new generation colliders such as the Electron Ion Collider (EIC) in the USA and the Large Hadron electron Collider (LHeC) at CERN, theoretical improvements of these distribution functions are mandatory for a precise comparison with experimental data. Motivated from this need, the main objective of the proposed project is to develop a comprehensive theoretical framework to study the multi-dimensional partonic content of the hadrons by combining various approaches starting from the first principles of QCD.

Expected results upon completion of the project:

Analytic evaluation of 3-loop 2-point Feynman master-integrals with composite external vertices for arbitrary indices of propagators.

Calculation of $\alpha_s^2(\alpha_s\beta_0)^{n-1}$ and $\alpha_s^3\beta_1(\alpha_s\beta_0)^{n-2}$ contributions in the nonsinglet ERL evolution kernel and correlator of two vector composite quark currents in QCD.

Calculation of pion electromagnetic form factors in the framework of light-cone sum rules in the low and (or) moderate energy regime.

Revision of distribution amplitudes (leading twist) of (pseudo)scalar and (longitudinal and transverse) vector mesons within QCD sum rules taking into account new QCD corrections $O(\alpha_s^2)$ obtained by us for all of their components.

Derivation and analysis of the full differential equation system for Feynman integrals with multiple parameters of masses and impulses.

Study of tau lepton decays and processes of electron-positron annihilation into mesons including the processes with three pseudoscalar mesons in the final state.

Investigation of the inner structure and nature of the meson interaction at low energies by using the Nambu–Jona-Lasinio model.

Study of the Drell-Yan hadronic structure function within the perturbative QCD in α_s^2 order of the coupling constant. Check of the Lam-Tung identity in α_s^2 order of the strong coupling constant.

Study of dark axion portal and obtaining bounds for the model in fixed target experiments. The analysis of new physics for NA64 experiment. Study of the visible mode of axion or dark photon.

Study of the sum rules for hadron fragmentation functions in QCD with the use of the generalized truncated Mellin moments approach.

Investigation of analytical and numerical optimizations of perturbative series for observables using the renormalization group in QCD.

Study of anomalous transport phenomena in a relativistic quantum medium associated with the curvature of space-time.

Study of the influence of the hadron potential at large distances on the total cross sections, which determines the peculiarity of the scattering amplitude at small momentum transfer. Investigation of the energy dependence and crossing properties of the new anomalous terms of the elastic amplitude of proton-proton and proton-antiproton scattering at NICA energies.

Study of the new-found types of transverse momentum dependent parton distributions within the original frame that involves the newly-found additional contribution in the inverse Radon transforms.

Study of the phase diagram of the SU(2)-Higgs Electroweak theory. Study of Z(N) symmetry and thermodynamic properties of meta-stable states at very high temperature in the context of QCD and Electroweak theory.

The creation of a computational framework to analyze CMS Open Data.

Expected results of the project in the current year:

Study of the tau lepton decays and processes of electron-positron annihilation with three mesons in the final state.

Study of heavy meson leptonproduction in the Generalized Parton Distributions approach.

Study of the charge sum rules for hadron fragmentation functions in QCD.

Study of inclusive hadron production in proton-proton and heavy-ion collisions at the NICA collider kinematics.

Study of exclusive production of massive vector mesons within QCD factorization approach.

Analytical and numerical optimization of perturbative series for observables using the renormalization group in QCD. Applications to the DIS sum rules.

Study of axion and vector portals between the Standard model and dark matter, implementation to fixed target experiments to obtain bounds for the model.

Investigation of the possibility of the existence of previously unknown phase transitions in a relativistic fluid of elementary particles in the region of ultralow temperatures and extremely high accelerations and vorticities.

Derivation of energy dependence of contribution estimates of tensor pomeron to spin-dependent amplitudes of nucleon-nucleon elastic scattering. Quantitative description of all available experimental data of the differential cross sections and spin-correlation parameters in elastic NN-scattering from $\sqrt{s}=5$ GeV up to $\sqrt{s}=14$ TeV.

Study of the contribution of effects induced by the effective one-loop action of Heisenberg-Euler QED, as well as its generalization to QCD, to the transport coefficients of transport effects (CME, CSE, CESE, CMW, CEW, CVE) in heavy ion collisions.

Theoretical substantiation of producing particles with orbital angular momenta in strong interactions in heavy-ion collisions.

Investigation of dissipative transport phenomena in non-inertial systems. Analysis of the connection between dissipative transport coefficients and conformal quantum anomaly.

Study of T-even hadronic structure function of Drell-Yan process.

Calculation of electric dipole moments of baryons.

Calculation of the differential cross section for elastic electron-proton scattering in an arbitrary reference frame, assuming that all particles involved in the process are polarized and that the electron mass is taken into account exactly.

Construction of an ε -dependent transformation of multiple zeta values of weights 16 and less, maximally eliminating terms containing powers of π from four-loop master integrals of two-point functions. Formulation of predictions for rational

coefficients of transcendental terms containing π as a factor in renormalization-group generators for a wide class of field theories in high (and in some cases, arbitrary) perturbative orders.

Investigation of dynamic fermion mass generation effects in (2+1)-dimensional QCD in the leading order of the large expansion.

Analytical evaluation of 3-loop 2-point Feynman master-integrals with composite external vertices for arbitrary indices of propagators.

Calculation of the correlator of two vector composite quark currents and the nonsinglet Efremov-Radyushkin-Brodsky-Lepage evolution kernel of the orders $\alpha_s^2(\alpha_s\beta_0)^{n-1}$ and $\alpha_s^3\beta_1(\alpha_s\beta_0)^{n-2}$ in QCD (α_s and β_0 are the strong coupling and (n+1)-loop coefficient of the beta-function α_s -expansion in QCD, resp.)

Development of a method for direct obtaining higher orders of ε -expansion of multivariate hypergeometric functions important for QCD applications.

Evaluation (making use of resurgent-analysis methods) of currently unavailable nonperturbative contributions to the QCD Adler function of the subleading order in large- n_f expansion (n_f indicates the number of quark flavors).

Study of exclusive J/Ψ production near the threshold to extract information on the gluon D-term.

3. Phenomenology of strong interactions and precision physics

V.I. Korobov
M.A. Ivanov

2024-2028

BLTP D. Aznabayev, G. Gurjav, A.N. Issadykov, D.I. Melikhov, Yu.S. Surovtsev, J. Tyulemissov, A. Tyulemissova

DLNP A.Bekbaev

Abstract and scientific rationale:

The project is expected to develop low-energy effective field theories: non-relativistic quantum electrodynamics (NRQED) and covariant quark model of hadrons (Covariant Confined Quark Model, CCQM).

The Standard Model of particle physics, formulated about 50 years ago, forms the basis of our understanding of fundamental interactions. During this time, significant theoretical work has been carried out to improve the calculation technique and increase the accuracy of predictions in the SM. An effective field theory (EFT) is a quantum field theory which is not fundamental but is valid over a limited range of energies or distances. This makes it possible to successfully use EFT and renormalization group methods to calculate real physical quantities and processes observed in the experiment with high accuracy. The EFT approach provides not only a systematic approach to the analysis of experimental results, but is also a valuable tool for determining the correlation of various observables, which gives a deeper understanding of where to look for possible indicators of new physics beyond the SM.

Expected results upon completion of the project:

Exploration of the possibilities of using the combined approach in NRQED, when part of the contributions to the energy of the bound system is considered in the framework of QED, as the total sum over all terms in the powers of the electron binding parameter $v/c \sim Z\alpha$.

Introduction of new terms in the general NRQED scheme, which will make it possible to take into account the contributions of light scattering on light, nontrivial centipede diagrams for one- and two-loop self-energy diagrams, necessary for calculating corrections of the order $m\alpha^7$ - $m\alpha^8$ and higher.

It is planned to study the spectra of pionic (π^- -He+) and kaonic (K^- -He+) helium atoms in order to refine the pion and kaon masses. The expected relative accuracy in mass measurements is $\sim 10^{-8}$.

Within the framework of CCQM, investigate the possibility of violation of lepton universality in lepton decays of charmonium and bottomonium and their radial excitations.

Obtain bounds on the values of the Wilson coefficients of the Standard Model Effective Theory (SMEFT) operators responsible for the violation of lepton universality in the tauon sector.

Calculate the partial widths of strong and electromagnetic decays of vector D-mesons with an open charm.

Calculate matrix elements and widths of nonleptonic two-particle decays of charmed baryons without changing the charm.

Perform an analysis of strong decays of the charmonium-like state $Y(4230)$ in order to study the nature of its structure.

Perform a theoretical analysis of lepton decays of the B-meson with four leptons in the final state.

Expected results of the project in the current year:

Analysis of the divergences arising in the bound state problem in NRQED, regularization of the divergences and recipes for subtracting the divergent part to calculate the final relativistic corrections in the orders $m(Z\alpha)^6$ and $m(Z\alpha)^6(m/M)$.

Obtaining an approximation of the contribution of the two-loop self-energy diagram by the effective interaction operator for calculating corrections of order $m\alpha^2(Z\alpha)^6$ and higher.

Obtaining the improved values for the proton-to-electron ratio and the Rydberg constant with a relative accuracy of $\sim 10^{-12}$ from the comparison of theory and experiment on H_2^+ spectroscopy.

Recent anomalies observed in $e+e^-$ nuclear transitions by the ATOMKI collaboration may hint at the existence of a vector boson with a mass around 17 MeV, referred to as X17. Similar anomaly was also observed by the BESIII collaboration in the Dalitz decay of the vector D-meson into a D-meson and an electron-positron pair. In this regard, it is planned to study in detail the decay of the vector D-meson into a D-meson and an electron-positron pair within the framework of CCQM.

Study of hidden-charm strong decays of the spin-2 partner $X(4014)$ of the charmonium-like state $X(3872)$ in the framework of the covariant confined quark model.

Calculation of the contributions from the final-state rescattering diagrams in the $B_s \rightarrow D^0 + \phi$ decay using the Kutkoski method. Calculation of the required form factors for strong two-particle decays in the CCQM model.

Calculation of the contributions from normal and anomalous thresholds using dispersion methods and comparison with the results of numerical calculations.

Calculation of the one-loop QCD corrections in radiative leptonic decays of B mesons in the arbitrary final state kinematics.

4. Theory of hadronic matter under extreme conditions

**V.V. Braguta
E.E. Kolomeitsev
S.N. Nedelko**

2024-2028

BLTP M. Bordag, J. Dey, M. Hasegawa, Y. Heo, Yu.B. Ivanov, A.S. Khvorostukhin, Nguyen Hoang Wu, A.V. Nikolsky, A.A. Roenko, A.M. Snigirev, D.A. Sychev, N.S. Tsegelnik, V.E. Voronin, D. Voskresensky

Abstract and scientific rationale:

Modern heavy ion accelerators make it possible to study the properties of strong interactions of elementary particles, which are described by quantum chromodynamics (QCD) under the influence of extreme external conditions. In particular, the quark-gluon matter that is created in such experiments is expected to have a temperature of several hundred MeV, the baryon chemical potential of about 100 MeV, external magnetic field $eB \sim 1 \text{ GeV}^2$ and relativistic rotation with an angular velocity of $\sim 10 \text{ MeV}$. Such conditions significantly change the properties of QCD. In the presented project, it is planned to study the properties of QCD at nonzero baryon density, high temperature, large external magnetic field and relativistic rotation using lattice simulation and other approaches.

Expected results upon completion of the project:

In the presented project, it is planned to study the properties of QCD at non-zero baryon density, non-zero temperature and non-zero magnetic field using lattice simulation with an imaginary chemical potential, dynamic u-, d-, and s- quarks and the physical mass of the pi-meson. To conduct such a study, a program written by our group will be used that implements advanced supercomputer technologies and algorithms.

It is expected that quark-gluon matter, which is produced in the process of collision of heavy ions, is not only highly heated and affected by a strong magnetic field but also has a non-zero angular velocity of rotation. Therefore, to interpret the results of heavy ion collision experiments, an important theoretical problem is the study of the properties of rotating quark-gluon matter. In the presented project, we are planning for the first time to study the properties of rotating quark-gluon matter in the framework of lattice simulation.

One of the aims of the project is to impose new constraints on the equation of state of the nuclear and hadronic matter under extreme conditions existing in heavy-ion collisions and the centers of compact stars. For this, the description of strongly interacting systems in and out of equilibrium will be developed. Such observables as the strange and charmed particle production, the directed and elliptic flows of particles, the global spin polarization of hyperons and their intercorrelations will

be analyzed within transport and hydrodynamic approaches and compared with existing and future experimental data. Various sources of the spin polarization such as local vorticity of the medium, axial vortex effect, and electromagnetic field will be quantitatively compared and their role in the formation of the observable polarization signal will be clarified.

The possibility of the thermodynamic description of light nuclei and hypernuclei production in heavy-ion collisions within the hydrodynamic approach will be theoretically explored. Formulation of the equations of the viscous hydrodynamics with the internal spin and rotation degrees of freedom as an effective field theory will be achieved. Possible phase transformation in nonequilibrium and equilibrium nuclear matter under the influence of compression, heating, magnetic field, and rotation will be classified and studied. New constraints on the equation of state from the description of the neutron star masses, radii, and the neutron star cooling should be obtained.

Elementary hadronic scattering amplitudes and the corresponding differential cross sections are important ingredients of transport models. The multichannel description of the meson-baryon scattering within the generalized potential approach based on the chiral SU(3) Lagrangian with the parameters tuned to the lattice QCD data and available experimental data on the hadron scattering will be developed.

Expected results of the project in the current year:

Analysis of various observables related to the production of ϕ mesons in heavy-ion collisions and study of their sensitivity to the phase transition in the QGP.

Study of scalar and vector bosons at rotation, in magnetic and electric fields and in the presence of nuclear matter.

Description of the resonance state of hadronic matter at a high temperature.

Lattice simulation of rotating QCD with u and d quarks and investigation of the influence of rotation on QCD phase transitions.

5. Theory of electroweak interactions and neutrino physics

**A.B. Arbuzov
V.A. Naumov**

2024-2028

BLTP A. Ahmedov, Yu.M. Bystritskiy, M. Deka, A.D. Dolgov, M.S. Dvornikov, S.B. Gerasimov, I.D. Kakorin, S.G. Kovalenko, K.S. Kuzmin, D.A. Kuznetsov, A.A. Nikitenko, N.N. Nikolaev, K. Nurlan, A.A. Osipov, N. Rajeev, D.S. Shkirmanov, V. Shmidt, M.K. Volkov, U.E. Voznaya, A.F. Zakharov, V.A. Zykunov

Abstract and scientific rationale:

The Standard Model of particle physics is the most successful theory of fundamental interactions. Despite numerous experiments on its verification and a deep theoretical study of its properties, there are still many problems in this model that need to be solved. The presence of such problems leads us to believe that the Standard Model is only an effective theory, i.e., a low-energy approximation of a more fundamental physical theory. To search for new physical phenomena, it is necessary to have high-precision predictions obtained within the framework of the Standard Model. Within this project, it is planned to obtain such predictions for the conditions of existing and future experiments at colliders, including LHC, FCCee, CEPC, ILC. Calculations will be carried out in order to carry out precise verification of the Standard Model (SM) and search for the limits of applicability of the latter.

Neutrinos are a unique source of information on physics beyond the Standard Model. In particular, reliably observed transitions between different types of neutrinos (neutrino flavors) indicate a violation of the conservation of the electron, muon and tau quantum numbers, which is present in the SM with massless neutrinos. The project is devoted to the study of physical processes involving neutrinos, including elementary exclusive interactions of neutrinos with nucleons and nuclei, neutrino transport in matter, taking into account coherent and inelastic interactions, study of astrophysical and cosmological effects, superhigh-energy neutrinos in cosmic rays, manifestation of neutrino oscillations in primary nucleosynthesis under extreme astrophysical conditions (in particular, in the vicinity of astrophysical black holes), as well as in accelerator and reactor experiments. In particular, the hypothesis about the possible existence of a sterile neutrino, its role in nucleosynthesis and the formation of the large-scale structure of the Universe will be considered. It is also planned to study a new mechanism for the production of ultra-high-energy neutrinos, up to 10^{21} eV (UHECR) in models of modified gravity in higher-dimensional space. Research carried out within the framework of this project will allow obtaining restrictions on models of compact objects, on the properties of particles (for example, on the mass of a graviton), as well as on alternative theories of gravity, which have been proposed recently. In recent years, reliable evidence has been obtained for the association of high-energy neutrinos with blazars, which are most likely supermassive black holes, and the construction of consistent models of these phenomena is also extremely important and timely. Cosmological and astrophysical phenomena predicted in modified gravity models will be investigated. First of all, scalar-tensor models of gravity will be considered and the manifestations of quantum field effects in them will be studied.

Expected results upon completion of the project:

Improvement of basic phenomenological models of electromagnetic nucleon form-factors in the space-like and time-like domains of q^2 based on the global statistical analysis of elastic electron scattering data on hydrogen and deuterium. Implementation of the models in the form of software modules of the GENIE neutrino generator. Application of the results to calculations of the cross sections of neutrino-nucleon interactions in the models of the running axial mass (M_A^{run}) and SuSAM*.

Improvement of the superscaling model SuSAM* with a modified scaling function based on a global statistical analysis of quasielastic electron scattering data on various nuclear targets (from hydrogen to uranium). Model implementation in the GENIE generator. Predictions of the momentum distribution of nucleons in the nucleus within the superscaling approach.

Improvement of the RK model of resonance neutrino production of pions with corrected contributions to the full amplitude based on the global statistical analysis of single pion production data in (anti)neutrino interactions with hydrogen and deuterium. Implementation of the model in the GENIE generator.

Development of a method for solving the quantum kinetic equations describing the transport of massive high-energy neutrinos in heterogeneous (astrophysical) media taking into account the neutrino mixing (including mixing with hypothetical sterile states) and their coherent and inelastic interactions with matter. Application of the theory to the calculation of the passage through the Sun of neutrinos generated by cosmic rays in the solar atmosphere (prediction of the flavor composition, energy and angular distributions). Evaluation of the corresponding background in the experiments on the detection of neutrinos generated by the annihilation of dark matter particles gravitationally bound in the Sun.

Study of the contribution of ultra-high-energy neutrinos arising in a multidimensional modification of gravity and comparison of theoretical expectations with observations with the Baikal-GVD and IceCube detectors.

Calculation of electroweak radiative corrections to electron-positron annihilation processes, which are planned to be studied at future colliders, including FCCee, CEPC and Super Charm-Tau Factory. Creation of computer programs that can be directly used to simulate and analyze data from experiments at these colliders.

Application of the method of parton distributions developed in QCD to describe electrodynamic corrections to processes studied in current and future experiments in the field of high energy physics.

Construction of high-precision theoretical predictions for Bhabha scattering processes at small and large angles used for luminosity monitoring at electron-positron colliders.

Analysis of semileptonic many-particle decay modes of tau leptons taking into account the excited states of mesons in intermediate states. Construction of a consistent scheme for describing such decays and creation of a computer program for simulating such processes.

Expected results of the project in the current year:

Calculation of polarization observables of the Bethe-Heitler process and the process of electron and electron-positron pair production to obtain a polarized positron beam.

Calculation of cross sections for the production of spin-3/2 baryons in electron-positron annihilation taking into account excited states of charmoniums.

Calculation of spin asymmetry in the processes of production of pseudoscalar mesons and bosons in proton-proton collisions under the conditions of the STAR experiment.

Description of electron-positron annihilation processes into mesons at energies up to 2 GeV using the extended Nambu-Jona-Lasinio model.

Study of isospin symmetry breaking effects in anomalous electromagnetic interactions of pseudoscalar mesons.

Studying the role of surface terms in the amplitudes of anomalous processes: generalization of the formalism to the case of unequal quark masses in two-loop quark diagrams.

Solution of the Balitsky-Fadin-Kuraev-Lipatov evolution equations in QED and their application to the description of the asymptotics of electrodynamic processes.

Calculation of higher-order radiative corrections to the processes of quasi-elastic scattering of neutrinos on nucleons.

Refinement of phenomenological models of nucleon Sachs form factors taking into account two-photon exchange contributions, analysis of the effect of the found corrections on the measured characteristics of tau leptons in quasi-elastic neutrino and antineutrino interactions with nucleons and nuclei.

Calculations of momentum distributions of secondary particles emerging from the decays of partially polarized tau leptons generated in near-threshold quasielastic neutrino and antineutrino interactions with nuclei.

Final tuning of the KLN-BS and MC models describing the resonant production of single pions in neutrino and antineutrino interactions with protons and neutrons, and comparison of the results with the predictions of competing models (in particular, with the dynamical coupled-channels model, DCC).

Development of the concept of broken superscaling in quasi-elastic electron-nucleus interactions, consisting in introducing a dependence of the scaling function on an additional momentum variable, and tuning of the model using available accelerator data on elastic and inelastic electron-nucleus interactions.

Derivation of new exact analytical equations of state for ideal equilibrium relativistic gases of particles and antiparticles within standard quantum statistics and parastatistics, establishment of universal relations between different representations, and determination of the convergence regions of their power series expansions.

Evaluation of the properties of the superfluid phase of neutrino clusters using methods of thermal quantum field theory and numerical simulation and application of the obtained results to solving the cosmological lithium abundance problem.

Establishment of constraints on the graviton mass within certain modified gravity models, calculation of its impact on cosmological evolution, and comparison of the obtained theoretical values with observational data.

Determination of the effects of mixing parameters and the mass of a hypothetical sterile neutrino on the kinetics of primordial nucleosynthesis, estimation of the modified abundance of light elements, and obtaining new cosmological constraints on the existence of sterile neutrinos.

Calculation of the probability and rate of graviton-to-photon conversion in the primordial magnetic field of the early Universe, estimation of the contribution of this process to the generation of cosmic microwave background radiation, and determination of potential observational consequences for the cosmic microwave background spectrum or the stochastic gravitational wave background.

Development of mechanisms for the dynamic suppression of vacuum energy, calculation of the effective cosmological constant within modified gravity models with a massive graviton, and establishment of the relationship between the graviton mass scale and the observed accelerated expansion of the Universe.

Calculation of the mechanisms of cosmic charge asymmetry generation due to the processes of asymmetric capture and quantum evaporation of primordial black holes (PBHs), and determination of the relationship between the PBH mass spectrum and the observed excess of visible matter.

Derivation of the quantum master equation from the von Neumann equation for a scalar field in de Sitter space, investigation of the transition to the Starobinsky stochastic regime via the Wigner function formalism, and calculation of quantum corrections to the Fokker–Planck equation.

Obtaining new constraints on the graviton mass and Yukawa potential parameters from the trajectories of bright stars near the Galactic Center, as well as modeling of shadows for naked singularities, wormholes, and dark matter distributions.

Theory of Nuclear Systems

Theme leaders:

N.V. Antonenko
A.A. Dzhioev
S.N. Ershov

Participating countries and international organizations:

Algeria, Armenia, Belarus, Belgium, Brazil, Bulgaria, China, Czech Republic, Egypt, France, Germany, Greece, Hungary, India, Iran, Italy, Japan, Kazakhstan, Lithuania, Mexico, Norway, Poland, Republic of Korea, Romania, Russia, Serbia, Slovakia, South Africa, Spain, Sweden, United Kingdom, USA, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:

The theme proposes to research and develop ways to solve current problems in nuclear physics, relativistic nuclear physics, nuclear astrophysics, in the field of quantum few-body systems, and nonlinear quantum processes. Researches will be closely coordinated with experimental programs at facilities that exploit high-intensity beams of stable and/or radioactive ions at JINR (SHE-factory, ACCULINA-2) and worldwide (FAIR, ISOL facilities, SPES, SPIRAL2, FRIB, RAON, HIAF, iThemba LABS, ELI-NP). Studies of collisions of high-energy heavy ions and the phenomenon of color transparency will be associated with the NICA project at JINR. Large-scale studies of the structure of exotic nuclei, the dynamics of nuclear reactions, properties and methods of obtaining superheavy nuclei are planned. The task is to include dissipation and diffusion in the dynamics of the nucleus-nuclear interaction and preserve the essence of the quantum multiparticle nature of colliding nuclei. The study of systems with a small number of particles is also necessary in order to describe resonant processes in nuclear physics and high-energy physics. Studies of nonlinear quantum processes in very strong polarized electromagnetic fields, which are achieved in short high-frequency laser pulses, are of interest.

Projects in the theme:

1.	Microscopic models for exotic nuclei and nuclear astrophysics	A.A. Dzhioev	2024-2028
BLTP	N.N. Arsenyev, E.B. Balbutsev, I.N. Borzov, H.G. Ganev, M.S. Kosarev, V.A. Kuzmin, L.A. Malov, M.A. Mardyban, I.V. Molodtsova, V.O. Nesterenko, A.P. Severyukhin, D.Yu. Smolyannikov, G. Stratan, A.I. Vdovin, P.I. Vishnevskiy		

Abstract and scientific rationale:

The scientific Project aims to solve a fundamental task of contemporary nuclear physics - development and improvement of a self-consistent microscopic approach to describe the structure of ground and excited states of exotic and superheavy atomic nuclei, as well as to predict their decay properties. On the one hand, such an approach is necessary for planning the research program of modern heavy ion accelerator facilities (SHE-Factory at JINR, SPIRAL2 at GANIL, FAIR at GSI, RIBF at RIKEN) and for interpretation of their results. On the other hand, the need for reliable theoretical nuclear data is also relevant for modeling various astrophysical processes.

The self-consistent microscopic approach used in the Project to describe ground and excited nuclear states is based on the combination of the energy density functional (EDF) method and the quasiparticle-phonon nuclear model (QPM). The EDF has proven itself in global calculations of nuclear characteristics and in astrophysics. The use of the coupling of simple and complex configurations in the framework of QPM is nowadays practically the only way allowing one to go beyond the harmonic approximation using large configuration space without violating the Pauli principle.

Expected results upon completion of the project:

The form and parameters of the EDF will be extrapolated far beyond the stability valley. Special attention will be paid to isovector properties, which play a crucial role in nuclei with large neutron-proton asymmetry.

Using a unified set of EDF parameters, the effect of interaction between simple and complex configurations on the properties of charge-neutral and charge-exchange nuclear excitations will be investigated with respect to their resonance structure as well as on the decay characteristics of nuclei at the driplines.

The developed self-consistent EDF+QPM framework will be applied to study β -decay in the context of astrophysical r-process and weak nuclear reactions with hot nuclei in various astrophysical scenarios (supernova explosions, stellar nucleosynthesis, neutrino emission).

Prediction of α spectra of superheavy nuclei for planning future experiments. α -decays from isomeric states as well as fission from these states will be considered.

In order to determine the competition between different modes of radioactive decay of superheavy nuclei, lifetime calculations concerning orbital electron capture and β^+ -decay will be carried out.

Analysis of the evolution of magic numbers as a function of the ratio of neutron to proton numbers in the nucleus and prediction of new nuclei with closed (sub)shells near the proton and neutron driplines.

Study of the role of tensor interaction in the fragmentation of the Gamow-Teller resonance and beta-decay of exotic nuclei.

Investigation of neutrino interaction with matter that is important in various astrophysical phenomena, e.g., supernovae, neutron star mergers, etc. The role of inelastic neutrino scattering on nuclei and the magnetic field in the neutrino thermalization process must be elucidated.

Calculations of charge and matter distribution radii for long isotopic chains, including deformed nuclei. Theoretical analysis of isotopic behavior of radii and observed anomalies.

Expected results of the project in the current year:

Study of the role of phonon-phonon interaction in the structure of the ^{90}Zr isomeric state.

Study of photoabsorption cross sections on spherical nuclei in a wide energy range.

Study of the spin-flip M1 giant resonance within the framework of the Wigner Function Moments method.

Study of the transition densities of 1^- spin-dipole excitations of even-even nuclei.

Development and application of the microscopic shell-model version of the particle-core-type models for description of odd-A nuclei.

Calculation of the total and partial rates of muon capture on even isotopes of selenium and barium.

Estimation of the influence of the inversion of neutron single-particle levels with $N > 126$ on the charge radii and beta decay rates of nuclei in the region of the third peak of the r-process.

Exploration of possible manifestations of E1 toroidal mode in the reaction (e,e'g).

Analysis of interplay between pygmy and toroidal E1 excitations in calcium isotopes.

Exploring proton–neutron pairing in hot nuclei.

BLTP	E.Kh. Alpomishev, A.V. Andreev, N.V. Antonenko, A.S. Bazhin, A.N. Bezbakh, R.V. Jolos, Sh.A. Kalandarov, E.V. Mardyban, N.S. Moiseev, A.B. Mukhammadsoliev, R.G. Nazmitdinov, A.K. Nasirov, D.T. MLIT	J. Busa, E.G. Nikonov
FLNR	A. Ajibekov, A. Isaev, T. Issataev, K. Mendibaev, Yu.V. Pyatkov

Abstract and scientific rationale:

The purpose of the project is to study the important dynamical nuclear processes such as fusion, quasifission, multinucleon transfers, capture and breakup. Investigations of the near threshold effects demand uniform description of the nuclear structure and reactions. Priority will be a development of cluster models that allow us to reveal peculiarities of the nuclear structure at extreme excitations. A further development of the completely quantum models for decays of weakly bound nuclei is planned. The transport coefficients and nucleus-nucleus potentials calculated microscopically would be used in the double-folding model for a description of the fusion dynamics.

It is necessary to study in detail the influence of the environment on the rate of astrophysical reactions. This demands further development of the theory of the quantum systems. Thus, it is necessary to consider low-energy dipole excitations that play presumably a noticeable role in stellar nucleosynthesis.

Study of the nuclear properties depending on an energy is necessary to reveal effects outside the mean field description. In heated nuclei, the potential energy surface changes in such a way that the height of the fission barrier for superheavy nuclei decreases. Therefore, investigations of the shell effects damping with increasing energy are important for estimation of the stability of excited heavy nuclei.

Exploring the formation of superheavies with $Z=119$ and 120 in fusion reactions must be continued within a microscopic approach. Also, the peculiarities of the quasifission competing with the complete fusion will be considered. There are plans to compare the calculated mass distributions and TKE of the quasi-fission products with distributions of the fission products. New heavy ion isotopes, which cannot be obtained in the complete fusion reactions, can be formed by transfer reactions. Therefore, further theoretical analysis of these reactions by including a cluster transfer into the description is required. Investigations of the synthesis of new isotopes of superheavy nuclei must be continued in the evaporation channels of charged particles in order to search for the most suitable reactions for future experiments.

The advantage of the cluster approach is the simultaneous description of α -decay and spontaneous fission from the ground state of both even-even and even-odd nuclei with the same set of parameters. The main model assumption is that charge asymmetry as a collective coordinate is responsible for these processes. In the same approach, it is necessary to investigate fission from isomeric states and induced fission. Success in describing experimental data will lead to a new insight into fission process.

Expected results upon completion of the project:

Creation of new theoretical approaches and models for description and prediction of the properties of unstable nuclei and exotic nuclear systems and their application to astrophysical problems.

Explanation of the reaction mechanism with particles and nuclei within the broad energy interval.

Exploring the limits of nuclear stability, positions of proton and neutron drip-lines, detection of proton shell closure beyond Pb, and the best way to produce a certain isotope.

Study of fusion and fission dynamics providing benchmarks for confirming certain ways of fusion and fission.

Investigation of the influence of the environment on astrophysical reactions.

Study of the nuclear structure change with temperature and angular momentum, the role of cluster degrees of freedom in nuclear excitations, and the properties of superheavies.

Exploration of the properties of nuclear systems beyond the nucleon stability, the multineutron radioactive decay existence.

Expected results of the project in the current year:

Investigation of the low-lying structure of ^{229}Th .

Study of the effect of mean field fluctuations on the single particle energies of soft nuclei.

Calculation of cross sections for the formation of new superheavy nuclei using the dinuclear system model and predictions of nuclear properties within the macroscopic-microscopic and self-consistent relativistic models.

Study of clustering during nuclear fission and its role in the formation of various fission modes.

Study of binary and ternary fission of heavy and superheavy nuclei within the dinuclear system model.

Study of the influence of higher order deformations on the formation and decay process of the ternary system within the microscopic-macroscopic approach.

Investigation of the possibility of synthesis of superheavy nuclei with $Z=119$ and $Z=120$ in complete fusion reactions in the framework of the dinuclear system model.

Development of a cluster model of the fission process in the framework of DNS model.

Calculation of the main observables of spontaneous fission for superheavy nuclei from Sg to Fl taking into account the evolution of the dinuclear system from the stage immediately following the crossing of the fission barrier to the scission point.

Analysis of the emergence of an asymmetric fission mode in the superheavy region and its influence on prompt-neutron multiplicities.

Study of the quantum correlations between the angular momenta of fission fragments within the dinuclear system framework and the influence of reflection-asymmetric and triaxial deformations of the DNS fragments at scission on the strength and character of fragment-spin correlations.

Calculation of the interaction potential of medium-mass nuclei within the extended Thomas-Fermi formalism with kinetic energy corrections and evaluation of their complete fusion cross sections within the Extended Quantum Diffusion Approach.

Description of low-lying states in medium-mass and heavy nuclei and the transition probabilities between them within the framework of the collective quadrupole model of nuclei.

Determination of spectroscopic factors of alpha particles and contributions of alpha-cluster states to the quadrupole moment within the cluster approach for nuclei from lead to strongly deformed heavy actinides.

3. Quantum few-body systems

VBLHEP A.A. Korobitsin

Abstract and scientific rationale:

The project is aimed at studying systems formed by a small set of constituents of nuclear, subnuclear or atomic-molecular origin. The smallness of the number of constituents in a system allows one to develop and use mathematically rigorous, precise and consistent approaches to its investigation, the approaches that do not require further simplifying physical assumptions and approximations. The goal of the project consists in developing and improving the methods of numerical solving of few-body problems in nuclear, atomic and molecular physics, and astrophysics. The developed approaches and methods will be employed in the numerical study of various concrete few-body quantum systems.

Expected results upon completion of the project:

Development of methods and approaches of the theory of few-body systems, settling some still remaining mathematical questions and issues. A contribution to Efimov physics with establishing new universal features in the behavior of ultracold few-body systems including the lattice few-body systems. Numerical calculations of ultracold three-atom systems in Efimov or pre-Efimov states by employing Faddeev equations. Theoretical study of non-stationary systems, in particular, the study of few-particle systems in varying external fields. Analysis of bound-state problems and scattering processes in low-dimensional few-particle systems. Development of the dynamical adiabatic theory and theory of hidden crossings of the potential-energy levels. Application of these theories to inelastic transitions in atom-atom collisions.

Expected results of the project in the current year:

Investigation of adsorption of superheavy elements on gold surface.

Drug–cell membrane biointeraction modeling.

Investigation of magnetic spin polarization in heavy nuclei.

Investigation of the rotational wave packet dynamics of molecules of the symmetric top type driven by a THz pulse.

Investigation of the m-photon resonance mechanism for production of twisted atoms and electrons with the circularly polarized laser pulses with the transfer of photon helicity to them.

Study of the Feshbach resonances of the second order in the Friedrichs model.

Comprehensive experimental and theoretical study of single ionization of the inner second orbital of the argon atom using Electron Momentum Spectroscopy at an incident electron energy of several keV.

Using the artificial neural networks as a way of analytic continuation of the Jost functions to the domain of complex energies.

Development of a phenomenological model for the relation between chromium silicide layer growth in binary silicon-chromium plate and chromium oxide growth on free surface of chromium.

Calculation of the total reflection effect in elastic scattering of an electron on a double layer of graphene.

Development of finite element method schemes for the analysis of confined quantum systems: a hydrogen atom or ion in a uniform magnetic field.

4. Relativistic nuclear dynamics and nonlinear quantum processes

**S.G. Bondarenko

2024-2028

BLTP A.V. Frizen, L.P. Kaptar, V.K. Lukyanov, A. Parvan, M.K. Slautin, A.I. Titov, S.A. Yuriev

MLIT Yu.L. Kalinovskiy, A.V. Khmelev, Lukyanov K.V., Zemlyanaya E.V.

VBLHEP A.A. Aparin, E.V. Nedorezov

Abstract and scientific rationale:

The aim of the project is to study the universal laws in relativistic collisions of heavy ions accompanied by various particles production; determination of the most important observables to test the equation of state of the nucleus; theoretical support for experiments at the NICA complex. The large nuclear transparency compared to the predictions of Glauber-like models may indicate the presence of color transparency and should be carefully considered. Based on the generalized eikonal approximation, nuclear transparencies in dd collisions will be calculated, which are available at NICA SPD. It is planned to study three/four-nucleon bound ($^3\text{He}, T, ^4\text{He}$) and scattering systems (elastic proton-deuteron) in the Bethe-Salpeter-Faddeev relativistic formalism. Study the properties of heated and compressed nuclear matter in the collision of heavy ions is based on the Nambu-Iona-Lasinio Polyakov loop model.

Our theoretical efforts are aimed at solving the following problems:

– improving transport approaches for describing the dynamics of relativistic collisions of heavy ions;

– identification of the most important observables in relativistic collisions of heavy ions to test the equation of state of the nucleus;

- study of the time of evolution of rapidly colliding systems to a local isotropic state in momentum space;
- study of the features of the interaction of high-energy gamma quanta with a strong laser field;
- consideration of relativistic effects in low-nucleon systems.

Expected results upon completion of the project:

Development of theoretical models and methods in the theory of nonlinear quantum processes of interaction of charged particles with intense electromagnetic fields. In this case, in addition to the dependence of observables on the field intensity, it is planned to study the polarization effects and the role of the shape and the carrier phase of the pulse.

Extension of the relativistic consideration of three-nucleon ($^3\text{He}, T$) systems in the formalism of the Bethe-Salpeter-Faddeev equation with separable interaction to four-nucleon systems in the Yakubovsky formalism (calculation of the ^4He binding energy, electromagnetic form factor of the system). Investigation of elastic proton-deuteron backscattering using the relativistic three-nucleon Bethe-Salpeter-Faddeev equation with a separable interaction kernel (taking into account nucleon rescattering diagrams). Consideration of the elastic electromagnetic form factor of the pion taking into account the anomalous magnetic moment of the quark in the framework of the covariant separable quark-quark interaction.

Study of the properties of heated and compressed nuclear matter in the collision of heavy ions. Of particular interest is the study of possible phase transitions that occur during the cooling of the system, as well as the problem of violation of CP invariance in strong interactions, which may be a consequence of the influence of the chiral anomaly on the topological structure of QCD vacuum in strong magnetic fields arising during the collision of heavy ions. The purpose of the study is to consider how the scattering cross section changes depending on the properties of the medium. Study of two-photon and Dalitz decays of light mesons within the NJL model at finite temperature and density. The production spectrum of dilepton pairs is directly related to various intermediate states of quark-hadron matter, and its study can provide information on phase transitions.

Investigations of the phenomenon of color transparency (CT), short-range nucleon-nucleon correlations and cumulative effect. Predictions for planned CPU search experiments at FAIR PANDA and NICA SPD. Based on the generalized eikonal approximation, taking into account the CT effects, we will calculate the nuclear transparency in the hard processes $d(d,2p)nn$ and $A(p,2p)$ with heavier nuclear targets ($A > 2$), for which the CT effects should be stronger.

Development of a solid theoretical basis for describing the interaction of a proton with a SRC pair in the nucleus, taking into account the NLS/VKD. Nucleon-nucleon short-range correlations (SRC) manifest themselves in interactions of high-energy particles with nuclei with sufficiently large momentum transfers ($Q > 1 \text{ GeV}$).

Investigation of the influence of the nuclear medium on such fundamental characteristics of the elementary NN amplitude as the total cross section for scattering of a nucleon by a bound nucleon of the nuclear medium, the energy dependence of the ratio of its real part to the imaginary part, as well as its slope parameter depending on the momentum transferred to the nucleon bound in the nucleus.

Calculation of exact hadronic distributions in transverse momentum and rapidity by new methods within the framework of Tsallis-1, Tsallis-3 and q -dual statistics and their application to describe experimental data for hadrons produced in collisions of heavy ions and protons with protons at LHC, RHIC, NICA and FAIR energies. Generalization of the quantum-statistical hadron model with exactly conserved strangeness of the system to the case of exact conservation of the baryon and electric charges of the system and finding recursive equations for the exact solution of the partition function and ensemble averages. The use of this model to calculate the multiplicity of identified hadrons produced in heavy ion collisions at LHC, RHIC, NICA and FAIR energies.

Investigations of the behavior of ghost and gluon propagators at finite temperature in an approach based on the Dyson-Schwinger equation in the Landau gauge in the truncated rainbow approximation. It is planned to investigate possible phase transitions from a bound state of a glueball to a free gluon plasma for the problem of phase transitions to a quark-gluon plasma in a hot nuclear medium (in processes in experiments at the NICA facility).

Expected results of the project in the current year:

Development of methods for a study of the in-medium effect on the fundamental characteristics of the nucleon-nucleon amplitude using a microscopic model of the optical potential. Analysis of the parameters of the nucleon-nucleon amplitude in the case when nucleons are bound in the incident nucleus and the target nucleus in a wide range of energies and atomic masses of the colliding nuclei.

Investigation of high order QED corrections to the lepton anomaly $g - 2$. Analytical calculations of the higher order (up to the 12th order) contributions due to bubble-like and mixed types of lepton loops in the vacuum polarization operator within the Mellin-Barnes representation.

Study of polarization observables for the $pd \rightarrow ppn$ reaction and comparison with available experimental data on T 20 for the kinematics with production of a cumulative proton.

Development of the Monte Carlo event generator for the reactions $^{12}\text{C}(p,ppn)^{10}\text{B}$ and $^{12}\text{C}(p,ppp)^{10}\text{Be}$ based on the translation-invariant shell model with the aim of its further application in the analysis of experimental data of the SRC@JINR collaboration.

Calculation of shear viscosity in a transport model for relativistic heavy-ion collisions using Tsallis non-extensive statistics.

Development of a method for solving the Bethe-Salpeter equation for bound systems and scattering states for a nonseparable (exchange) kernel of interaction. Application of the resulting method to solve the inhomogeneous Bethe-Salpeter-Faddeev equation for describing scattering in a three-particle system at medium and high energies. Calculation of the proton-deuteron scattering length and comparison of the obtained results with non-relativistic calculations and experimental data.

Study of the mass characteristics of baryons at finite temperature for describing the dynamics of nuclear matter in heavy-ion collisions within the framework of the extended Linear Sigma Model (eLSM) with two, three and four quark flavors.

Calculation of the longitudinal cross section of pion electroproduction on a proton using electromagnetic semi-off-shell pion and rho-pi-gamma form factors calculated in the Bethe-Salpeter formalism with a separable kernel.

Study of nonlinear quantum processes in the interaction of photons and charged particles with intense laser fields taking into account polarization.

Calculation of the cross section and polarization characteristics of the elastic proton-deuteron scattering reaction in the covariant Bethe-Salpeter formalism in one-nucleon exchange.

Theory of Complex Systems and Advanced Materials

Theme leaders:

V.A. Osipov
A.M. Povolotsky

Participating countries and international organizations:

Armenia, Australia, Belarus, Brazil, Bulgaria, Canada, China, Egypt, Finland, France, Germany, India, Iran, Japan, Kazakhstan, Mongolia, Poland, Romania, Russia, Serbia, Slovakia, South Africa, Sweden, United Kingdom, USA, Vietnam.

The problem under study and the main purpose of the research:

The most important directions of fundamental research will be theoretical studies of physical phenomena and processes in condensed matter, studies of the properties of new advanced materials, constructing and analysis of theoretical models and the development of analytical and computational methods for their solution. Complex materials such as high-temperature superconductors, magnetic materials, smart composite materials, fractal and layered structures are supposed to be studied and a wide class of systems with strong electronic correlations will be analyzed. Theoretical research in this area will be aimed at supporting the experimental study of these materials carried out at the Frank Laboratory of Neutron Physics, JINR. It is planned to conduct research in the field of physics of nanostructures and nanomaterials, in particular, using the software packages for modeling physical and chemical processes and for analysis of physical characteristics. First of all, these are modern two-dimensional materials such as graphene, transition metal dichalcogenides, etc., including their modification and chemical functionalization for a subsequent use in the design of new devices for nanoelectronics, spintronics, etc. Partly, these studies are focused on experiments held at the FLNR Center for Applied Physics JINR, Nanobiophotonics Centre at FLNP JINR, the Institute of Semiconductor Physics SB RAS and a number of other laboratories of the JINR Member States. The physical properties of stacks of Josephson junctions and various Josephson nanostructures will be studied in detail. Much attention will be paid to the analysis of both lattice and field models of equilibrium and nonequilibrium systems of statistical mechanics. The concepts of scaling and universality allow one to go beyond the model approach and apply the results obtained to broad classes of phenomena studied in the physics of condensed matter. Studies of a wide range of universal phenomena in complex systems – phase transitions in condensed matter and high-energy physics, scaling in (magneto)hydrodynamic turbulence, chemical reactions, percolation, etc. by the methods of quantum field theory including the functional renormalization group are supposed to be carried out.

Abstract and scientific rationale:

Enormous recent progress in both the art of sample preparation and the measurement techniques has produced a wealth of high quality data on thermodynamic, transport, structural and spectroscopic properties for new complex materials that exhibit unconventional forms of magnetism, showing evidence for strong electronic and magnetic correlations, or having fractal properties at nano and microscales. These materials attract now considerable attention for various applications, e.g., in quantum computing or in describing the physical and chemical properties of colloids, biological systems, granular materials etc.

Expected results upon completion of the project:

Estimation of the exchange parameters of Kitaev materials based on transition and rare-earth metals and calculation of their spin-wave spectrum.

Magnetic phase diagrams in strongly-correlated electronic systems within the t-J model for electron doping.

Explaining the structure of systems of dense random packings in nano- and micro-materials.

Development and application of quantum algorithms for computational problems in condensed matter physics and quantum chemistry.

Development of a theory of stability for mixtures of quantum fluids.

Understanding the irradiation resistance of various compounds.

Expected results of the project in the current year:

Description of spatial correlations in dense power-law polydisperse packings by means of scaling functions.

Investigation of phase transitions in power-law-polydisperse disk systems.

Study of the crossover between mass and surface fractal regimes in small-angle scattering from dense power-law polydisperse disks.

Study of the phase diagram of the Kitaev-Heisenberg honeycomb ferromagnet.

Phase diagram of the J1-J2 model on a triangular lattice using Minimally augmented spin-wave theory.

Simulation of high field magnetization data of square-kagome nabokoite $\text{KCu}_7\text{TeO}_4(\text{SO}_4)_5\text{Cl}$.

Development of the theory of coherent modes in trapped systems with nonequilibrium Bose-Einstein condensates.

Investigation of the admissible time-dependent regimes of complex systems modelled by dynamic probabilistic networks.

Development of methods for describing nonlinear systems with strong particle interactions.

Calculation of the quantum mechanism of charge transfer in the DNA molecule based on the Lindblad equation and tensor network methods.

Application of tensor networks to optimize the parameters of spin chain models for highly efficient quantum state transfer.

Derivation of the necessary formulae and their inclusion in the existing numerical code for the complementary numerical-experimental studies of quasi-two-dimensional structures in positron spectroscopy experiments.

Interaction between Rydberg excitons in atomically thin semiconductors.

2. Mathematical models of statistical physics of complex systems**A.M. Povolotsky**

2024-2028

BLTP G.Y. Chitov, V.V. Papoyan, P.N. Pyatov, V.P. Spiridonov

Abstract and scientific rationale:

Non-perturbative studies of large-scale systems with many interacting degrees of freedom constitute an important part of modern theoretical physics that has been experiencing a growing interest of researchers during the last decade. Recent advances in this direction are based on the construction and investigation of exactly solvable models of equilibrium and non-equilibrium statistical physics, quantum mechanics and related quantum field theories. Then, with the use of the concepts of scaling and universality the results obtained from the exact solutions can be extended to vast classes of physical phenomena far beyond the realm of such systems. The exact solvability of models of physical systems is provided by their special mathematical structure coined by the term integrability. The models with such a structure is the major subject of studies within the current project.

The project is aimed at further exploration of the field of exactly solvable models of statistical physics, quantum mechanics and quantum field theories, which requires a development of new theoretical tools based on the theory of integrable systems and discovery of new mathematical structures standing behind the exact solvability. The main objectives of the project consist in obtaining exact results about universal laws in interacting particle systems with stochastic dynamics and models of random interface growth, models of equilibrium statistical physics including percolation, polymers and other two-dimensional lattice models and quantum spin chains, studies of known and construction of new types of special functions playing the role of building blocks in the theory of integrable systems and computations of partition functions (superconformal indices), studies of known and construction of new algebraic structures standing behind the integrability concept.

Expected results upon completion of the project:

Construction and complete classification of one-dimensional stochastic models of interacting particles based on representations of Hecke algebras and related two-dimensional lattice models of interacting paths, as well as obtaining their exact solutions using the Markov duality methods.

Calculation of exact cluster densities and their asymptotic expansions in percolation models, as well as loop densities in associated densely packed loop models on lattices with different boundary conditions, construction of asymptotic expansions of thermodynamic quantities characterizing the behavior of free-fermionic models on lattices of finite size, such as dimers, Ising model and spanning tree models with different geometry under various boundary conditions. It is also planned to study the boundary behavior of nonlocal correlation functions in models of dense polymers and spanning trees, as well as to describe the limiting forms and universal fluctuations of polymer configurations in these models.

Application of the studied models of polymers and quantum spin chains to problems from related fields of quantum mechanics and biophysics. Among them are the studies of "entangled states" and magnetic properties of complex quantum spin systems related to the problems of quantum computing, the use of a rotor-router model (Eulerian walks) to study the dynamics of double-stranded DNA breaks.

Development of mathematical structures behind the integrability. In particular, further study of the properties of elliptic beta integrals and elliptic hypergeometric functions and their various limiting forms, new applications of these functions to quantum field theory, quantum and statistical mechanics and soliton theory, construction of complex hypergeometric functions on root systems in the Mellin-Barnes representation and study of their connections to the two-dimensional conformal field theories. Finding generalized modular transformations for elliptic hypergeometric integrals and description of their consequences for superconformal indices (statistical sums) of four-dimensional supersymmetric field theories. It is also planned to generalize the obtained results to the cases of rarefied hypergeometric functions of various types and describe the relevant physical systems, as well as to investigate connections between soliton solutions of integrable equations, lattice Coulomb gases, non-local Ising chains and ensembles of random matrices.

Construction and study of new algebraic structures underlying integrability and their use for constructing new integrable systems that could be useful in various applications. Generalization of the Hamilton-Cayley theorem to the case of orthogonal type quantum matrix algebras and study of the subalgebra of spectral values of orthogonal quantum matrices. Construction of an analogue of the Gauss expansion in the reflection equation algebras, and development of the representation theory of these algebras.

It is also planned to study a series of R-matrix solutions of the braid relation, which make it possible to model stochastic reaction-diffusion processes and study the possibility of constructing new link/knot invariants using new series of R-matrices.

Expected results of the project in the current year:

Classification of stochastic vertex models possessing full sets of Markov dualities used for construction of infinite hierarchies of multipoint correlation functions that give a full characterization of the corresponding probability measures on particle configurations. Study of the universal limiting behaviour of these measures in the scaling limit.

Studies of the magnetic properties and entanglement entropy of antiferromagnetic, star-shaped homometallic and heterometallic four- and five-core systems.

Application of the rotor-router model, also known as the Eulerian walk, to the description of the dynamics of recovery of double-stranded polymer breaks.

Development of the Vershik-Okounkov approach to the representation theory of algebras describing the discrete symmetries of quantum-mechanical and statistical models. Application of this approach to the classification of irreducible representations of Birman-Murakami-Wenzl algebras.

Reduction of N-particle integrable hyperbolic Ruijsenaars model to the complex analogues of rational Ruijsenaars model and hyperbolic Sutherland model. Construction of the corresponding Baxter Q-operator and Hamiltonian eigenfunctions.

Investigation of the Schrodinger equation with the potential related to the third Painleve function whose spectrum is determined by the conformal algebra.

Obtaining analytically the asymptotics of the block Toeplitz matrices for calculations of the order parameters in a modulated quantum chain.

Explanation of cascades of percolation transitions in models of cellular automata from the analysis of the Lee-Yang zeros of the generalized partition functions of non-equilibrium stationary states and the transfer-matrix spectra.

3. Nanostructures and nanomaterials

V.L. Katkov

2024-2028

BLTP M. Abdelghani, K.K. Kesharpu, E.A. Kochetov, S.E. Krasavin, K.V. Kulikov, N.L. Matsko, I.R. Rahmonov, M.A. Salem, N.M. Shchelkachev, D.A. Shokhonov, Yu.M. Shukrinov, I.K. Sobolev, P.B. Sorokin

MLIT I. Sarhadov, E.B. Zemlianaya

FLNP G.M. Arzumanyan

FLNR V.A. Skuratov

LRB A.N. Bugay

Abstract and scientific rationale:

It is planned to conduct research in the field of physics of nanostructures and nanomaterials, in particular, using the software packages for modeling physical and chemical processes and for analysis of physical characteristics. First of all, these are modern two-dimensional materials such as graphene, transition metal dichalcogenides, etc., including their modification and chemical functionalization for a subsequent use in the design of new devices for nanoelectronics, spintronics, etc. Partly, these studies are focused on experiments held at the FLNR Center for Applied Physics JINR, Nanobiophotonics Center at FLNP JINR, the Institute of Semiconductor Physics SB RAS and a number of other laboratories of the JINR Member States. It is planned to analyze topological superconductivity in strongly correlated electronic systems in order to find possible applications for the transmission and storage of quantum information. The physical properties of stacks of Josephson junctions and various Josephson nanostructures will be studied in detail.

The main goal of the project is a theoretical study of the properties of new promising materials, primarily nanostructures and nanomaterials. This is explained not only by the fundamental nature of the physical properties of these materials but also by their practical importance for designing new electronic devices, as well as devices for storing, processing and transmitting information, sensors and biosensors, and others.

Expected results upon completion of the project:

The project is aimed at solving tasks in the following areas:

– in order to identify materials with promising properties for use as a component base for a new generation of electronics, it is planned to study thermal and electron transport in low-dimensional materials of various configurations and chemical composition. An analysis will be made of the role of functionalization, structural modification, the influence of thin layers, polycrystalline, structural defects, and other factors. Experimental studies are carried out in cooperation with the Educational and Scientific Technological Laboratory "Graphene Nanotechnologies" NEFU in Yakutsk (synthesis), the Institute of Semiconductor Physics SB RAS (synthesis, characterization, functionalization), FLNP JINR (characterization, functionalization, irradiation) and FLNR JINR (ion irradiation to create nanopores);

- analysis of topological superconductivity in strongly correlated electronic systems in order to search for possible applications for the transmission and storage of quantum information and for the study of non-standard quantum transport that is insensitive to local noise sources;
- study of dynamic, transport and chaotic phenomena in hybrid Josephson nanostructures with magnetic materials for the purposes of superconducting spintronics. Modeling of quantum phenomena in Josephson qubits (memory elements);
- study of the properties of polarons in low-dimensional materials and nanostructured objects. Analysis of plasmon-phonon interaction and plasmons in nanoscale and massive objects.

Expected results of the project in the current year:

Study of fundamental manifestations of electron-phonon interactions in various functionalized low-dimensional and nanostructures in the calculation of mobility, conductivity, and electronic spectrum.

Study of the sensitivity and selectivity of a sensor based on a field-effect transistor with a polycrystalline graphene channel, analysis of a wide range of grain boundary configurations with different misorientation angles.

Calculation of the phase diagram of the SSH-Peierls model and the Kreutz ladder taking into account the electron-electron interaction in an external magnetic field using mean field theory and density matrix renormalization group (DMRG) methods. Calculation of the phase diagram of the Kitaev-Heisenberg model on a honeycomb lattice exhibiting a helical spin structure.

Analysis of the mutual influence of superconductivity and magnetism in a Josephson superconductor-ferromagnet-superconductor (SFS) structure, including the shunt case. Calculation of stable dynamic states and the current-voltage characteristic in a SFS structure on a topological insulator, including also under the influence of an external current pulse.

Study of magnetization dynamics and quantum correlation in a hybrid Josephson junction. Theoretical development of reconfigurable interconnection architectures based on hybrid Josephson junctions.

Investigation of the possibility of observing synchronized chaos and quantum phase transition in an array of nanomagnets coupled with a Josephson junction.

Analysis of the emergence of new types of "optical" and "acoustic" magnons associated with the anomalous Josephson effect based on a one-dimensional Josephson metamaterial consisting of Φ_0 junctions.

Development of an approach combining an evolutionary algorithm with a machine learning potential and adaptive fine tuning, and testing on the Fe–Ni–Ca ternary system with a prediction of a new Ca–Fe–Ni ternary compound at pressures of about 100 GPa.

Study of the stability and structural dynamics of contacts in electrode–molecule–electrode systems using neural network potentials trained on DFT data and systematic investigation of contact evolution under mechanical stretching and temperature effects. Description of critical structural transitions and nonlinear molecular diffusion that significantly affect the strength and functionality of molecular devices.

Calculation of the interaction of electronic excitations in molecular complexes of C_{60} and PTCDA with substrates based on graphene and MoS_2 . Calculation of the electronic properties and transport in perovskite crystals $CsPbBr_3$ and mixed single crystals based on it $CsPb(Br_{1-x}Cl_x)_3$.

4. Quantum field theory methods in complex systems

M. Hnatič

2024-2028

BLTP L.Ts. Adzemyan, N.V. Antonov, N.M. Gulitskiy, G.A. Kalagov, M. Ketser, M.V. Kompaniets, N.M. Lebedev,
L. Mižišin, Yu.M. Molotkov, M.Yu. Nalimov, A.V. Ovsyannikov

MLIT J. Buša

Abstract and scientific rationale:

Complex physical phenomena such as developed turbulence, transport phenomena, non-equilibrium phase transitions, percolation, chemical reactions and surface growth in random media are difficult to study theoretically and experimentally; however, in the light of their wide distribution in nature such studies prove themselves to be very valuable.

The main task of the project will be the formulation of the corresponding theoretical models, which can be investigated using the methods of quantum field theory and non-equilibrium statistical physics. The main goal is to study the statistical characteristics of fluctuating fields in the region of large spatial scales, identify phase transitions and to calculate universal critical exponents and non-universal amplitudes.

Dynamic nonlinear systems in which non-equilibrium (stochastic) fluctuations of physical quantities play a decisive role, is one of the most important research topics by leading scientific teams in the world. They cover a wide range phenomena, which we observe in the world around us.

Notable examples of stochastic processes include: hydrodynamic and magneto-hydrodynamic turbulence, describing, in particular, turbulent movements in the Earth's atmosphere and oceans, the spread of pollutants in them (including chemically active), as well as chaotic motions of plasma on the surface of the sun and in space. One of the important consequences of the existence of mechanical instabilities in electrically conducting turbulent media is an exponential growth of magnetic fluctuations leading to the formation of observed nonzero averaged magnetic fields only due to the kinetic energy of the turbulent medium.

Another important example of stochastic systems is percolation processes. They describe phenomena such as seepage in porous media, filtration, spread of infectious diseases, forest fires and others. Their universal feature is the existence of a non-equilibrium phase transition to an inactive (absorbing) state that extinguishes all activity of the observed system. Obviously, the study of transitions between a stationary active and the inactive phase is of great practical importance.

The main object of the study is physical quantities that depend on space-time coordinates and therefore are fluctuating fields, and the measured quantities are their statistical averages. The most important of them are non-zero average field values, response functions, multipoint correlation functions, two-point simultaneous correlations (structural functions), including composite fields (operators). In the region of large spatial and temporal scales, their scaling behavior with universal critical exponents is observed. The analysis of stability regions of scaling regimes and the calculation of indices is a priority goal in the study of stochastic nonlinear systems.

The main goal of the project is to study stochastic nonlinear dynamic systems such as developed (magneto)hydrodynamic turbulence, non-equilibrium phase transitions, phase transitions in systems with high spins, kinetics of chemical reactions, percolation processes, surface growth in random media and self-organized criticality.

Expected results upon completion of the project:

Investigation of the crossover in systems of multicomponent fermions within the BEC-BCS functional renormalization group: analysis of phase diagrams and calculation of transition temperatures to the ordered state. Approbation and adaptation of computational methods for solving non-perturbative equations of the functional renormalization group.

Development of computational methods for calculating the contributions of multi-loop diagrams to the renormalization group functions of dynamical models. Investigation of the dynamics of the superconducting phase transition in low-temperature superconductors.

Study of the effects associated with the violation of mirror symmetry in magneto-hydrodynamic developed turbulence. Calculation of two-loop Feynman diagrams generated by the Lorentz force and two-loop diagrams of the response function leading to an exponential growth of magnetic field fluctuations in the region of large scales. Study of the phenomenon of turbulent dynamo.

Construction of effective field-theoretical models of chemical reactions of various types of particles occurring in random media. Study of the infrared scaling behavior of statistical correlations of particle densities by renormalization group methods.

Study of isotropic and directed percolation. Calculation of multi-loop Feynman diagrams generating ultraviolet divergences. Finding fixed points of the renormalization group equations and calculating critical exponents for physically significant and experimentally observable quantities - response functions, density of active nodes (agents), effective radius and mass of active zones.

Study of the effect of isotropic motion of a medium with different statistical characteristics on the possibility of anisotropic scaling in the Hua-Kardar self-organized criticality model. Investigation by the functional renormalization group method of possible asymptotic regimes corresponding to the non-universal scaling behavior of a surface growing in a random environment and described by a model that includes an infinite number of types of interactions.

Expected results of the project in the current year:

Study of a family of composite operators of dimension two in helical magnetohydrodynamics. Renormalization group calculation of the alpha coefficient (alpha effect) in a saturated dynamo state.

Five-loop calculation in infinite-dimensional turbulence. Renormalization group analysis of the ϕ^3 tensor model in the fifth order of perturbation theory. Multi-loop analysis of a dynamic generalization of the ϕ^3 model in four loops.

Analysis of long-range spreading in multi-component reaction-diffusion systems. Generalization of the existing formalism to account for super-diffusion spreading with different coefficients for different particle species.

Study of active turbulent advection of a scalar field with a non-linear self-interaction of the Kardar-Parisi-Zhang type by means of field-theoretic renormalization group, identification of possible asymptotic scaling regimes and calculation of the corresponding critical exponents.

Phase diagrams of reaction–diffusion systems in a random turbulent velocity field obtained within the functional renormalization group approach.

Account for partial Gallium symmetry breaking due to the interaction of a moving medium with a vector defining the anisotropy of the initial system in a systematic study of the interaction of anisotropic systems with self-organizing criticality described by the Hua-Kardar model with an isotropic moving external medium described by the stochastic Navier-Stokes equation.

Renormalization group analysis of Model A of critical dynamics in the case of a non-Gaussian distribution of a random external force establishing and quantitatively describing possible scaling regimes.

Study of diffusion of scalar quantity in strongly compressible medium described by stochastic Burger's equation. Finding stable fixed points corresponding to possible types of scaling behavior and computing the corresponding critical dimensions.

Tan's contact for ultracold spinor Bose gases computed within the functional renormalization group approach.

Investigation of the critical glass transition from the melt and solid phases.

Modern Mathematical Physics: Integrability, Gravity and Supersymmetry

Theme leaders: A.P. Isaev
S.O. Krivonos

Participating countries and international organizations:

Armenia, Australia, Brazil, Bulgaria, CERN, China, Czech Republic, Egypt, France, Germany, Greece, Iran, Ireland, Israel, Italy, Japan, Kazakhstan, Kyrgyzstan, Poland, Portugal, Republic of Korea, Russia, Saudi Arabia, Serbia, Spain, United Kingdom, USA.

The problem under study and the main purpose of the research:

The main task of the Theme is the development of mathematical methods for solving the most important problems of modern theoretical physics, namely: development of new mathematical methods for studying and describing a wide class of classical and quantum integrable systems and their exact solutions; analyzing and searching for solutions to a wide range of problems of supersymmetric theories, including models of strings and other extended objects; study of nonperturbative regimes in supersymmetric gauge theories; development of cosmological models of the early Universe, gravitational waves and black holes.

BLTP H.D. Dimov, A.A. Golubtsova, N.Yu. Kozyrev, M.A. Podoinicin, A.A. Provorov

Abstract and scientific rationale:

Our project is devoted to important problems of modern mathematical physics. The three most important investigation directions of the project are the study of holographic duality, construction of supersymmetric theories and description of unitary irreducible representations of Poincare groups in higher dimensions. Each of these directions can be regarded separately but in our project we concentrate our attention on the problems which lie on the borders of these major directions. As byproducts, we study certain applied problems, including those that arise in connection with booster thematic.

Expected results upon completion of the project:

The first problem of the project is the study of algebraic and differential structures in holographical systems, which belongs to the subject of modern mathematical physics considered in the context of holographic duality. This part of the project is focused on the study of properties of integrable systems appearing in holographical models.

The second problem is devoted to the construction of an action of the non-Abelian $N=(1,0)$, $d=6$ tensor multiplet possessing as many as possible numbers of properties of six dimensional superconformal theories. This problem is related to the first one since it is devoted to field theories with extended supersymmetry which are very important in the mathematical physics studies since they help to describe common properties of quantum fields theories and many aspects of the string theory.

The third problem of our project arises in the context of studies of the models with higher spin fields requiring a certain description of unitary irreducible representations of Poincare groups and symmetry groups of AdS spaces. According to Wigner, each irreducible representation of the four-dimensional Poincare group is associated with an elementary particle (field). This conception is generalized to the case of arbitrary dimension and to the case of other groups including supergroups. Therefore, when studying different field models, one first of all asks the question of classification and explicit construction of unitary irreducible representations of the symmetry group of the studied theory.

Expected results of the project in the current year:

Obtaining deformed (doubly deformed) holographic background geometries in the context of Maldacena's holographic hypothesis at the conformal point.

Calculation of anomalous dimensions of operators in holographic dual theories and testing holographic correspondence beyond the supergravity approximation.

Construction of quantum theory of a system of non-Abelian tensor fields obtained by dimensional reduction using the BRST-BFV and BV methods.

Establishment of dualities that relate the non-Abelian tensor theories obtained by dimensional reduction. Construction of a self-dual system of non-Abelian tensor fields by dimensional reduction of a Pasti-Sorokin-Tonin-type action.

Construction of solutions to Wigner-type equations for continuous-spin fields in AdS spacetime of arbitrary dimension. Interpretation of solutions in the context of the AdS/CFT correspondence.

Investigation of energy losses of light quarks in the context of holographic duality.

Construction of the Vogel-universal decomposition of the tensor product of the representations Y_2 and Y_k into irreducible components. Derivation of universal formulas for the dimensions of the resulting new families of universal representations.

Determination of the universal structure of the representation ad^5 for an arbitrary simple Lie algebra.

Founding the equations of motion for continuous-spin fields of mixed-symmetry type in anti-de Sitter space of arbitrary dimension, in particular, investigation of the structure of leading asymptotics and the boundary data required to specify such fields.

Construction of L and R operators for the $N=4$ superconformal algebra $SU(2,2|4)$ as solutions of the Yang-Baxter equation.

Calculation of planar "fishnet" Feynman diagrams for $N=4$ supersymmetric Yang-Mills theory.

2. Supersymmetry, higher spins, gravity

**E.A. Ivanov
S.A. Fedoruk**

2024-2028

BLTP A.A. Averiyarov, I.L. Buchbinder, A.S. Budekhina, E.T. Musaev, A.P. Nersessian, G.A. Sarkissian, Ya.M. Shnir, S.S. Sidorov, A.O. Sutulin, N.M. Zagraev

Abstract and scientific rationale:

The project is aimed at solving fundamental problems of modern theoretical physics associated with the development of superfield methods in gauge theories with extended supersymmetry in various dimensions, including extended supersymmetric mechanics. The implementation of the project includes the construction of new field and quantum-mechanical models with global and gauge symmetries, the development of new, including geometric, methods for studying the structure of these models at the classical and quantum levels, the study of the structure of the corresponding quantum effective actions and classical solutions of these models, including black holes. All tasks of the project are set by the modern development of theoretical physics and are organically joined by the unity of methods and approaches.

Expected results upon completion of the project:

Calculating all leading and subleading in the dimensional regularization parameter two-loop counterterms in 6D, $N=(1,0)$ and $N=(1,1)$ supersymmetric gauge theories.

Constructing a one-loop induced effective action in the theory of hypermultiplet interacting with $N=2$ supergravity in the harmonic superspace approach.

Development of the methods of calculation of the one-loop induced effective action in the theory of hypermultiplet coupled to

external fields of $N=2$ harmonic gauge superfields.

Derivation of 4D, $N=2$ harmonic superfield formulation for $N=2$ supersymmetric gauge fermionic higher spin fields.

Working out 4D, $N=2$ superfield gauge theory of higher spin fields in the AdS space.

Development of effective methods for describing gauge fields and superfields of an infinite spin in an arbitrary space-time dimension.

Finding Lagrangians describing the interactions of infinite spin fields and higher spin fields with fields of a fixed spin.

Finding out superfield harmonic Lagrangians of sigma models obtained by T-duality from 2D, $N=(4,4)$ supersymmetric hyperkahler and quaternion-kahler sigma models.

Building a superfield matrix formulation of new $N=4$ and $N=8$ supersymmetric extensions of integrable many-particle systems and their quantization.

Construction of new models of N -extended supersymmetric quantum mechanics by using the superfield gauging method, which describe the interaction of dynamic and semidynamic multiplets of various types.

Construction and study of $N=4$ models of supersymmetric mechanics based on the interaction of linear and nonlinear supermultiplets with the component content $(4,4,0)$, $(3,4,1)$ and $(2,4,2)$.

Constructing the Hamiltonian formulation and performing quantization of the generalizations of systems with the nonlinear $(2,4,2)$ supermultiplet.

Constructing an extension of $N=4$ supersymmetric mechanics with $(3,4,1)$ supermultiplet to the class of systems parametrized by an arbitrary holomorphic function.

Construction and study of many-particle systems with nonlinear supermultiplets.

Construction of a superfield description of Calogero-type models with extended $N \geq 4$ supersymmetries.

Analysis of the integrability of N -extended supersymmetric systems of the Euler–Calogero–Moser and Calogero–Moser–Sutherland types for the $A(n-1)$ series of the Coxeter group.

Finding an explicit form of the functionally independent conserved Liouville currents in $N=2$ supersymmetric Calogero models for all root systems of Coxeter groups.

Construction of two new exactly calculated rarefied elliptic beta integrals associated with special lens spaces and a special subgroup of the modular transformations group $SL(2, \mathbb{Z})$.

Computation of a matrix of modular transformations of one-point conformal blocks on a torus in the Neveu-Schwarz sector of the $N=1$ superconformal Liouville field theory, based on the expression of this matrix as an integral of the product of certain elements of the fusion matrix.

Obtaining the difference equations for the fusion matrix in the Neveu-Schwarz sector of the $N=1$ superconformal Liouville field theory.

Finding a new class of solutions of GR with gauge multicomponent matter fields in models with spontaneous symmetry breaking.

Constructing and exploring a new class of solutions of extended Einstein gravity with the Chern-Simons term that represents stationary rotating black holes.

Expected results of the project in the current year:

Calculation of two-loop subleading divergences in 6D, $N=(1,1)$ supersymmetric SYM theory.

Construction of induced effective action in the hypermultiplet theory coupled to background $N=2$ supergravity in harmonic superspace.

Investigation of the effective action of $N=(1,0)$ SYM theory with higher derivatives and testing it for the presence of $N=(0,1)$ hidden symmetry.

Development of the BRST Lagrangian formulation for free fermionic higher spin fields in AdS_4 space.

Construction of Lagrangian formulation for partially massless fermionic higher spin fields in AdS_4 space.

Construction of free $N=2$ conformal higher spin theories within the harmonic approach.

Study of $N=2$ higher-spin supercurrents of the system of vector multiplet and hypermultiplet. Construction of the corresponding conformal multiplets of half-integer spin.

Construction of Casimir operators of superalgebras with central charges in the harmonic approach.

Study of the Wess-Zumino type gauge in the harmonic formulation of $N=2$ supergravity and its application to solving the zero-curvature equations and component reduction of supergravity theories.

Construction of linearized $N=2$ AdS supergravity.

Construction of a G_2 exceptional field theory and, based on this theory, construction of gauged $D=3$ supergravity with the full duality group G_2 .

Search and classification of $SO(3)$ and $SO(2,1)$ gaugings in the reduced $D=3$ theory. Construction of geometric and non-geometric consistent truncations of the minimal $D=5$ supergravity to the obtained gauged supergravities.

Establishment of a connection between the generalization of the classical Yang-Baxter equation related to poly-vector deformations and various generalizations of the quantum Yang-Baxter equation: decorated equation, tetrahedron, and loop-algebra.

Study of many-particle models of extended supersymmetric mechanics and superconformal mechanics based on the interaction of linear and nonlinear supermultiplets, including cases of using indecomposable supermultiplets and semidynamical multiplets.

Construction of new integrable Coulomb-type systems characterized by the presence of Wu-Yang monopoles. Establishing the relationship of these systems to the Rosochatius CP^3 system and finding their exact classical and quantum solutions, as well as exploring the possibility of their $N=4$ supersymmetric extensions.

Study of the reduction of the parafermion Ruijsenaars model to the parafermion relativistic Toda model, which yields a parafermion version of the q -deformed Whittaker function. A study of the nonrelativistic limit of the parafermion Toda model.

Construction and study of a new class of black holes with scalar matter fields in asymptotically flat 3+1-dimensional spacetime in the models featuring a partially negative potential.

Construction and analysis of the properties of new soliton solutions in the scalar Maxwell-Chern-Simons gauge theory with a periodic potential

3. Quantum gravity, cosmology and strings

I.G. Pirozhenko
D.V. Fursaev

2024-2028

BLTP A. Afzal, E.A. Davydov, B.N. Latosh, A.B. Pestov, O.P. Santillan, V.A. Tainov, P.V. Tretyakov, Ya.M. Shnir

Abstract and scientific rationale:

The project is aimed at solving the fundamental problems of classical and quantum gravity and conducting advanced theoretical research at the national and world level in this area at BLTP JINR. In classical gravity, the project is focused on studying all kinds of gravitational wave phenomena, including shock waves in General Relativity, as well as various sources of gravitational wave background such as cosmic strings. One of the directions of the project is the elaboration of cosmological models that explain the properties of the observable Universe based on field theory methods and modified gravity. In the field of quantum gravity, it is planned to develop an apparatus of quantum field theory in an external classical gravitational background and new methods for an approximate estimation of the effective gravitational action in various regimes. Asymptotic symmetries in gravity, the relationship between gravity, thermodynamics and quantum entanglement, the holographic properties of gravity, and the AdS/CFT correspondence will also be explored.

Expected results upon completion of the project:

Development of field theory methods against the background of shock gravitational waves using the method of supertranslations at the wave front; study of classical field effects induced by shock waves, including the astrophysical applications.

Study of classical effects in the gravitational field of shock gravitational waves, including the case of the gravitational field induced by null cosmic strings (cosmic strings moving at the speed of light); study of gravitational (electromagnetic) radiation induced by the motion of null cosmic strings near massive (charged) sources, estimation of the parameters of these objects corresponding to the observed characteristics of induced radiation.

Study of physical effects associated with the formation of caustics and other defects on the world sheet of the null cosmic string as possible sources of gravitational bursts; development of the holonomy method proposed for describing free classical fields against the background of a gravitational shock wave.

Quantization and study of quantum effects in the gravitational field of shock gravitational waves, calculation of the expectation value of the renormalized energy-momentum tensor.

Derivation and study of the properties of exact solutions of the Einstein equations related to the subject of this project, for example, the search for non-trivial solutions that have global hyperbolic isometry and allow the introduction of holonomy associated with these transformations.

Study of the gravitational entropy associated with various surfaces in Riemannian geometry, in particular, study of the entropy formed when the light cones of the past and future (causal diamonds) intersect, as well as study of quantum corrections and renormalization of this quantity.

Further development of spectral geometry methods applied to nonlinear spectral problems; using these methods to study the finite-temperature QFT on stationary manifolds of a general form, as well as the application of this theory to calculate the effects of quark-gluon matter taking into account rotation and acceleration.

Study of cosmological models of modified gravity, an attempt to explain on their basis the key characteristics of the observed cosmology such as the accelerated expansion of the Universe; the study of cosmological perturbations in a teleparallel theory with a non-minimal scalar-tensor coupling, where the main object is the torsion scalar, in contrast to general relativity, where the main object is the Ricci scalar.

Construction of integrable cosmological potentials for spatially flat cosmologies with one scalar field for searching and constructing realistic completely integrable inflationary models with a phase transition; study of phase transitions in quantum theory, including gravity, and the formation dynamics of walls separating regions with different field values, the development of the thick-wall approximation method taking into account gravity, as well as the construction and study of exactly solvable inflationary models with phase transitions.

Development of methods in the framework of the Picard-Lefschetz theory and their application for calculating Lorentz path integrals in problems of quantum field theory, gravity and cosmology, and, in particular, in problems of describing the lensing of gravitational waves.

Expected results of the project in the current year:

Study of the possible contribution of the second-order expansion of the metric tensor to the effective averaged energy-momentum tensor of gravitational waves in some modified gravity models, in particular those containing a function of the Ricci scalar in the Lagrangian.

Study of cosmological dynamics in models of quadratic symmetric teleparallel gravity. Comparison of the obtained results with available observational data and exploration of the possibility of solving the so-called Hubble tension within such models.

Development of a realistic warm-inflation model with a Majoron field coupled to confining dark gauge sector through a mixed quantum anomaly. A systematic analysis of the background inflationary dynamics, computation of primordial perturbation spectra, estimation of viable parameter space consistent with current CMB constraints (Planck, BICEP/Keck).

Further study of perturbations of classical electromagnetic fields in Minkowski spacetime caused by the action of gravitational shock waves from compact sources: formulation of the Cauchy problem for perturbations by taking into account the gauge constraints, analysis of secondary electromagnetic shock waves, and analysis of the radiated energy.

Study of gravitational radiation generated by the motion of ultrarelativistic sources in a medium with a mass distribution, construction of models and new mechanisms, which yield the observed stochastic gravitational wave background for such sources, calculation of their contributions to the energy density of the Universe, and comparison with experimental data.

Calculation of the linear memory effect for the background metric due to the passage of a gravitational shock wave.

Calculation of the perturbations of electromagnetic and gravitational fields generated by ultra-relativistic jets in active galactic nuclei.

Development and integration into FeynGrav of a specialized computational module for fast Lorentz-index contraction. Alternative implementations based on FORM and a purpose-built standalone program will be benchmarked, and the selected solution will be validated on representative perturbative quantum-gravity calculations.

Implementation of the support for the Rarita-Schwinger field of spin (3/2) in FeynGrav. The implementation will include the free theory, the corresponding propagator, and the lowest-order interaction vertices between the Rarita-Schwinger field and gravity, thereby providing the computational basis for subsequent applications to supergravity.

Investigation of the possibility of reformulating gravity coupled to fermions in tetrad-based variables with a finite number of interaction vertices. The study will result in either a polynomial formulation of the relevant action, together with the corresponding Feynman rules, or a precise obstruction demonstrating why a direct tetrad analogue of the Cheung-Remmen parametrization cannot provide such a formulation.

Elementary Particle Physics and High-Energy Heavy-Ion Physics (02)

Participation in international experiments

02-1-1066-2007

Investigation of the Properties
of Nuclear Matter and Particle Structure
at the Collider of Relativistic Nuclei and Polarized Protons

Theme leaders: R. Lednický
Yu.A. Panebrattsev

Participating countries and international organizations:
Armenia, Azerbaijan, Bulgaria, China, Cuba, Czech Republic, Egypt, France, India, Kazakhstan, Mexico, Mongolia, Russia, Serbia, Slovakia, USA, Vietnam.

The problem under study and the main purpose of the research:
Investigation of the properties of nuclear matter with extremely high density and temperature, search for the signatures of the quark deconfinement and possible phase transitions at the collisions of heavy nuclei at the energies of the Relativistic Heavy Ion Collider (RHIC). Measurement of spin dependent structure functions of nucleons and nuclei using polarized proton beams at RHIC.

Project in the theme:		Project code
Name of the project	Project leaders	Status
Laboratory	Responsible from laboratories	
1. STAR	Yu.A. Panebrattsev	02-1-1066-1-2010/2027
	R. Lednický	
	Deputy:	
	A.A. Aparin	Realization
VBLHEP, MLIT, BLTP, UC	the list of participants is given in Activities	

Abstract and scientific rationale:
The goal of the STAR project (JINR participation) is to study the properties of nuclear matter at extreme densities and temperatures, to search for signatures of quark deconfinement and possible phase transitions in heavy ion collisions over a wide energy range at the Relativistic Heavy Ion Collider (RHIC). The research program also includes the study of the structure functions of quarks and gluons in collisions of transversely and longitudinally polarized protons.

Expected results upon completion of the project:
Obtaining information about the properties of hot, dense nuclear matter. Participation in experiments with nuclei and polarized protons at the STAR facility at the RHIC nuclear collider at BNL.

Measurement at the STAR facility of spin effects in experiments with polarized protons. Obtaining new information about the spin – dependent distribution functions of quarks and gluons in the proton and fragmentation function.

Research of femtosopic correlations, structure of events and scaling properties of nuclear interactions, global polarization, and vector and tensor alignment, events with wide transverse momenta.

Conducting experiments on the Beam Energy Scan program BESII in the collider mode and in the fixed target mode. Search for signatures of phase transitions and critical points of QCD.

Development of the STAR detector software and creation of corresponding infrastructure at JINR for processing and analysis of experimental data of the STAR facility at JINR.

Development of a System for Precision Polarization Degree Measurements Based on Silicon Detectors for the SPI facility (Source of Polarized Ions) according to the method of a Coulomb-nuclear interference (CNI polarimetry).

Creation of the joint educational programs in relativistic nuclear physics and physics of the microworld together with BNL and JINR member states universities.

Expected results of the project this year:
Analysis of experimental data using the BESII energy scan program in collider experiments in the energy range 7.7–200 GeV and experiments with a fixed target in the energy range 3.0–11.5 GeV. Search for signatures of phase transitions and the QCD

critical point.

The study of spectra of K_s^0 meson production in AuAu collisions at the energy 19.6 GeV using high-precision, high-statistics datasets from the STAR Beam Energy Scan (BESII) over a wide range of transverse momentum (0.0–6.0) GeV/c and for seven centralities.

The study of event structure, collective variables, correlation characteristics, femtoscopic correlation functions and high- p_T processes. Study of femtoscopic correlations in the energy range from 3 to 7.7 GeV. Study of the nuclear modification factor in collisions of gold nuclei at energies of 7.7, 11.5, 14.6, 19.6 and 27 GeV.

The study of residual third-body Coulomb and isospin effects of colliding nuclei on final particle distributions, production ratios, and of particle pairs femtoscopic correlations at high baryon density region.

The study of femtoscopic correlations of K_s^0 meson pairs taking into account Quantum Statistics and Final State Interactions. Determination of the femtoscopic parameters as a function of the average transverse momentum meson pair and collision centrality. Software development and creation of infrastructure for processing STAR data at JINR using GRID technologies. Using machine learning methods for data processing. Creation of media resources and laboratory works with the BNL and universities of the participating countries for training personnel to work at colliders of relativistic nuclei and polarized protons. Development of a polarimeter using the Coulomb-nuclear scattering method for monitoring the polarization level of the NICA accelerator complex beam. Calculation of kinematic parameters of experiments on the study of the nucleus structure functions and the spin structure of the proton in e-p and e-A, p-p, p-A with respect to the collision energy. Development of a physics program for experiments at small (Nuclotron range) and high energies (EIC range). Participation in the preparation of long-term archiving system and access to data recorded by the STAR experiment during data collection.

Activities of the theme:

Name of the activity	Leaders	Implementation period
Laboratory Responsible from laboratories		Status
1. Participation in experiments and data analysis according to the BESII energy scan program. Search for signatures of phase transitions and the QCD critical point	Yu.A. Panebrattsev	2024-2027
		Data taking Data analysis
VBLHEP	A. Aitbayev, A.A. Aparin, G.S. Averichev, T.G. Dedovich, V.B. Dunin, A.O. Kechechyan, A.A. Korobitsyn, E.V. Nedorezov, S.S. Panyushkina, Oris Suarez Eng, V.V. Tikhomirov, A.A. Timofeev, M.V. Tokarev, Vinh Ba Luong, G.A. Yarygin	

Abstract and scientific rationale:

Data processing using the BESII energy scan program in collider mode and in fixed-target mode.

Expected results upon completion of the activity:

Drawing conclusions about phase transition signatures and the QCD critical point based on data analysis of the BESII program.

Expected results of the activity this year:

Study of event structure, collective variables, correlation characteristics, femtoscopic correlation functions and high- p_T processes. Study of femtoscopic correlations of identical charged pions in the energy range from 3 to 7.7 GeV. Study of femtoscopic correlations in the energy range from 3 to 7.7 GeV. Study of the nuclear modification factor in collisions of gold nuclei at energies of 7.7-27 GeV.

The study of femtoscopic correlations of K_s^0 meson pairs taking into account Quantum Statistics and Final State Interactions. Measuring thermodynamic parameters of medium using statistical models.

2. Study of spin effects in collisions of transversely polarized protons with protons and nuclei. Measurement of inclusive transverse spin asymmetries and fragmentation functions	M.V. Tokarev	2024-2027
		Realization

VBLHEP A.A. Aparin, T.G. Dedovich, E.I. Schakhaliev, Oris Suarez Eng, O.V. Teryaev

MLIT Zh.Zh. Musulmanbekov

Abstract and scientific rationale:

Study of the structure functions of quarks and gluons in collisions of transversely and longitudinally polarized protons at an energy of 510 GeV and in collisions of polarized protons with nuclei at an energy of 200 GeV. Analysis of experimental data using the Cold QCD program.

Expected results upon completion of the activity:

Conducting experiments with longitudinally and transversely polarized protons at a maximum energy of 510 GeV.

Analysis of experimental data using the Cold QCD program. This allowed us to study the distributions of Sievers, transversity, Collins fragmentation functions in previously inaccessible regions and expand the program for the analysis of asymmetries of the production of $W^\pm$ and Z^0 bosons.

Expected results of the activity this year:

Implementation of an experimental program with transversely polarized protons at an energy of 200 GeV.

Performing measurements in a wide range of pseudo-rapidities of $-1.5 < \eta < 1.5$ (central region) and $2.8 < \eta < 4.2$ (forward rapidity), corresponding to the range of Bjorken variable $0.005 < x < 0.5$.

3. The study of event structure, collective effects, femtoscopic correlations and high- p_T processes

R. Lednický
Yu.A. Panebrattsev

2024-2027

Realization

VBLHEP G.N. Agakishiev, A.A. Aparin, T.G. Dedovich, A.O. Kechechyan, A.A. Korobitsyn, Vinh Ba Luong, S.S. Panyushkina, E.V. Nedorezov, E.I. Schakhaliev, A.A. Timofeev, M.V. Tokarev

MLIT G.A. Ososkov

Abstract and scientific rationale:

Further development and application of correlation femtoscopy methods developed at JINR for the analysis of experimental data.

Expected results upon completion of the activity:

Study of the space-temporal parameters of the production processes using correlations of identical and non-identical particles, including hyperons, considering the interaction in the final state and spin correlations, to clarify the equation of state of dense and super dense nuclear matter similar to that in neutron stars.

Expected results of the activity this year:

The fractal structure of events is studied as a function of transverse momentum. Manifestations of nuclear effects are analyzed through the fractal analysis of Monte Carlo Au+Au events at a collision energy of 200 GeV and various centralities using a Multi-Phase Transport generator. The influence of the string melting scenario on the shape of p_T spectra for fractal and non-fractal events is investigated. The behavior of the event fractal dimension spectrum is examined as a function of centrality.

Publication of the study on the effects of residual charges and isospin of colliding nuclei on femtoscopic correlations of identical charged pions in the energy range 3–7.7 GeV. Study of the effect of boost-invariance breaking in the pair-rapidity dependence of femtoscopic radii.

Study of the production of neutral kaons in the region of small transverse momenta.

The study of fractal structure of nuclei in the cumulative hadron production in the framework of z-scaling approach.

Investigation of subtle effects in relativistic heavy-ion collisions from STAR data using high-order Q-cumulants.

Comparison of volumes extracted from transverse-momentum distributions and femtoscopic correlations using the statistical Blast-Wave model.

4. Data analysis of the STAR measurements in the rapidity region of $2.5 < \eta < 4.2$, based on statistics on collisions of gold nuclei at an energy of 200 GeV and the maximum luminosity of the RHIC collider

Yu.A. Panebrattsev

2024-2027

Data processing Data analysis

VBLHEP A.A. Aitbaev, G.N. Agakishiev, A.A. Aparin, G.S. Averichev, T.G. Dedovich, A.O. Kechechyan, Vinh Ba Luong, O.V. Rogachevsky, E.I. Schakhaliev, M.V. Tokarev

MLIT N.I. Gromova

Abstract and scientific rationale:

Implementation of an experimental program with heavy nuclei using the Hot QCD Physics program in the extended acceptance of the STAR facility in the region of high rapidity and increased luminosity of the RHIC collider.

Expected results upon completion of the activity:

Investigation, within the framework of the Hot QCD Physics program, of the microstructure of QGP in gold-gold collisions at the energy of 200 GeV to refine the QCD phase diagram and determine the properties of QGP at small scales.

Expected results of the activity this year:

Obtaining experimental data of the Hot QCD program for collisions of gold nuclei at a maximum energy of 200 GeV and maximum luminosity of the collider.

<p>5. Development of the software and formation of the infrastructure for the STAR data processing at JINR. Application of machine learning methods for data processing</p>	<p>Yu.A. Panebrattsev V.V. Realization			

VBLHEP G.N. Agakishiev, A.A. Aparin, A.A. Korobitsyn, P.D. Semchukov

MLIT N. Balashov, G.A. Ososkov, T.A. Strizh

Abstract and scientific rationale:

Using distributed computing capabilities (JINR GRID structure) to process data from the STAR experiment. Development of machine learning methods for analyzing experimental data from the STAR facility.

Expected results upon completion of the activity:

Preparation of experimental data from runs 2022–2024 in the formats for data processing at JINR.

Development of new data processing methods.

Expected results of the activity this year:

Preparation and adaptation of the developed method for particle identification based on machine learning methods for the MPD and SPD experiments.

<p>6. Creation of media resources and laboratory works with the BNL and universities of the participating countries for training personnel to work at colliders of relativistic nuclei and polarized protons</p>	<p>N.E. Sidorov K.V. Klygina</p>	<p>2024-2027</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>Realization</td> </tr> </table>	Realization
Realization			

VBLHEP E.I. Golubeva, N.A. Lashmanov, M.P. Osmachko, D.O. Ponkin, P.D. Semchukov, V.K. Velichkov, N.I. Vorontsova

UC S.N. Balalykin, Hoang Bao Han Nguyen, L.V. Platonova, O.A. Smirnov, T.G. Stroganova

Abstract and scientific rationale:

Development of media resources and laboratory works for training personnel to work at colliders of relativistic nuclei and polarized protons.

Expected results upon completion of the activity:

Preparation of educational and presentation materials on studying the structure of matter and nucleus-nucleus interactions in experiments at colliders (RHIC, NICA).

Expected results of the activity this year:

Creation of a new exhibition about the NICA/MPD accelerator complex using elements of virtual, extended and augmented reality. Creation of remote laboratory works for studying nuclear physics.

Preparation of an interactive course on the study of physical processes and the recording and reconstruction of events at the MPD and STAR facilities.

7. Development of proposals on creating detectors for study of polarization phenomena at colliders **V.B. Dunin**

2024-2027

Project development

VBLHEP N.V. Dunin, V.V. Fimushkin, K.A. Ivshin, A.N. Solovev

Abstract and scientific rationale:

Development of proposals for the creation of detectors for polarimetry at the NICA collider.

Expected results upon completion of the activity:

Creation of a polarimeter that will provide an accuracy of about 2 % in 300 seconds at a current of 10 mA.

Expected results of the activity this year:

Production of a prototype of a universal proton polarimeter, where it is planned to place 4 clusters of silicon detectors placed at angles of 110 and 130 degrees, allowing to measure the asymmetry in the ${}^6\text{Li}(p, {}^3\text{He}){}^4\text{He}$ reaction.

Testing of the polarimeter prototype on an alpha particle source and a 5 MeV deuteron source.

Determining the final polarimeter design and its fabrication.

Creation of a hardware platform for precision polarization degree measurements at the SPI source to expand its functional capabilities for experiments within the SPD NICA program.

8. Study the possibility of future expansion of the investigation of nuclear structure and proton spin structure in e - p and e -A collisions at the NICA complex, as well as study the possibility of participating in the development of the Electron-Ion Collider (EIC) project **A.A. Aparin**

2024-2027

Project development

VBLHEP V.B. Dunin, A.A. Korobitsyn, N.A. Lashmanov, S.S. Panyushkina, V.Yu. Rogov, Oris Suarez Eng

BLTP A.S. Zhevlakov

DLNP A.S. Zhemchugov

Abstract and scientific rationale:

Further prospects for research in the field of relativistic nuclear physics are associated with the creating and conducting experiments at electron-ion colliders. Studies of spin effects at the EIC appear to complement the physics program of the SPD experiment at the NICA collider.

Expected results upon completion of the activity:

Together with JINR Member States, participation in the preparation of the EIC physics program. Preparation of proposals for the participation of the JINR group in the development of the technical design of one of the detectors for studying electron-ion collisions.

Expected results of the activity this year:

Calculation of kinematic characteristics of p-p and p-A collision experiments and search for variables accessible for experimental study phase boundaries in the beam velocity y and particle transverse momentum p_T . Calculation of the necessary accelerator luminosity parameters and interaction rate for conducting experiments with the specified setup.

ATLAS

Upgrade of the ATLAS Detector and Physics Research at the LHC

Theme leader: V.A. Bednyakov

Deputies: A.P. Cheplakov
I.V. Yeletsikh

Participating countries and international organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, Canada, CERN, France, Georgia, Germany, Israel, Italy, Netherlands, Russia, Slovakia, Spain, USA.

The problem under study and the main purpose of the research:

Studies of the proton-proton interactions at unprecedented collision energies (up to 14 TeV), in particular, investigation of the nucleon structure, measurements of the Higgs-boson properties, searches for new phenomena beyond the Standard Model, studies of the heavy quarks and multi-quark states, precision Standard Model tests, participation in software support of the ATLAS experiment, modelling of the physical processes and upgrade of the detector systems. Development and production of detecting systems of the ATLAS facility, participation in operation of the facility.

Project in the theme:

Abstract and scientific rationale:

The main purpose of the international ATLAS experiment is investigation of proton-proton interactions at unprecedented energies at the LHC collider (from 7 to 14 TeV center-of-mass energy). These interactions are the source of different (including unknown) physical processes between elementary particles. Study of such processes and their description within a common framework represent the main problem of the modern physical science.

The ATLAS multipurpose facility is unique and unprecedented regarding its performance and complexity. It combines the most up-to-date advances of science, technology and communication. Participation in such a large-scale international project gives access to the cutting-edge technologies of the physical experiment, allows gaining experience in real data analysis, precision modelling of the physical processes, software and theoretical support of experiment and looks absolutely necessary for such an international organization as JINR.

The second phase of the ATLAS detector upgrade is aimed at preparing the facility for operation in the conditions of high luminosity of the LHC. During the first phase, which was successfully completed in 2022, the main contribution of the JINR group was participation in the implementation of the project to create a new muon wheel, an important element of the muon spectrometer. The modernization of the muon spectrometer continues in terms of creating RPC cameras. The development, testing and manufacturing of a system for reading signals from a liquid-argon calorimeter (LAr) based on fiber optic technology is underway. With the participation of JINR, a new high-granularity timing detector (HGTD) is being developed.

The ATLAS experiment is currently performing a number of precision tests of the Standard Model, probing the limits of its validity and searching for the answers to the key questions of the modern physics like the nature of dark matter, existence of additional spacial dimensions, etc.

Expected results upon completion of the project:

Analysis of pp-collisions data at 13.6 TeV as well as High-Luminosity LHC (HL-LHC) data are going to provide the new and unique experimental results. The most important among them are investigation of the proton structure, in particular, the transverse momentum density of gluons in proton; studies of the heavy hadron spectra, including beauty mesons and exotic tetraquark and pentaquark states; precision SM tests at LHC energies and searches beyond the SM. The High Luminosity regime of the LHC will allow studies of the processes, e.g., Higgs-boson production in association with a single top-quark.

Achieving these goals is impossible without developing new methods of data analysis. The active participation of JINR physicists is planned in the trigger software support, development of new methods of detector simulation, application of the machine learning techniques in physics analysis.

The implementation of this Project aimed at solving highly significant scientific problems will yield unique applied results. Among these 'byproduct' results are the experience in operation of remote monitoring systems for technically complicated devices, big data processing and development and practical use of distributed computing systems (GRID) and database monitoring applications in long-term large-scale experiments. Applications of this experience if possible in other JINR projects.

Completion of the modernization of the detector systems will ensure stable and efficient operation of the ATLAS facility with the LHC luminosity at a level 5-7 times higher than the design value of about $10^{34} \text{ cm}^{-2} \text{ s}^{-1}$, and reaching the integrated luminosity at the level of 3000 fb^{-1} .

Expected results of the project this year:

Publication of the results of spin properties study of fully charmed tetraquarks in their decays to J/ψ - J/ψ and J/ψ - $\Psi(2S)$ mesons. Measurement of the hidden-charm tetraquark and pentaquark with hidden charm $T_{cc}(4200)$, $P_{cc}(4312)$, $P_{cc}(4440)$, $P_{cc}(4457)$ in B-meson and Lambda_b-baryon decays to J/ψ + light hadrons. Analysis of the Higgs boson production in association with a single top quark, measurement of the Higgs-top coupling phase in Run3 data. Continuation of the search for quantum black holes in the lepton+jet channel, publication of results based on full Run3 statistics. Continuation of the studies of Higgs boson production in association with vector W-, Z- bosons, measurement of Higgs boson couplings to b- and c-quarks in this channel.

Development and support of the ATLAS conditions database software, in particular, the calorimeter subsystem databases. Trigger software support. Calorimeter simulation and modeling of the ATLAS calorimeter response. Participation in the Phase-2 ATLAS Upgrade Project of the muon spectrometer and calorimeters: RPC detectors, fiber optic and electric cables for the LAr calorimeter; continuation of works on prototyping, production and commissioning of the High Granularity Timing Detector.

CMS

Compact Muon Solenoid at the LHC

Theme leader: V.Yu. Karjavin

Deputy: S.V. Shmatov

Scientific leader: V.A. Matveev

Participating countries and international organizations:

Armenia, Austria, Belgium, Brazil, Bulgaria, CERN, China, Croatia, Cyprus, Finland, France, Georgia, Germany, Greece, Hungary, India, Iran, Ireland, Italy, Mexico, Montenegro, Netherlands, New Zealand, Pakistan, Republic of Korea, Serbia, Spain, Switzerland, Taiwan, Turkey, United Kingdom, USA.

The problem under study and the main purpose of the research:

Development and implementation of a research program at the LHC accelerator complex to study phenomena within the standard model and beyond; modernization, commissioning and operation of the CMS experimental complex. Upgrade, commissioning and operation of the CMS experimental complex.

Abstract and scientific rationale:

The project aims to extensive research in the field of elementary particle physics with the CMS experimental facility at the LHC. The priority goal is to study fundamental laws of nature.

The project involves an analysis of the physics processes in proton-proton collisions with a collision energy up to 13.6 TeV in the c.m.s. By the end of the LHC RUN3 the CMS experiment will collect experimental data with statistics corresponding to an integrated luminosity of up $L_{\text{int}} = 500 \text{ fb}^{-1}$. Processing and analysis of this data will help to obtain new physics results in the following areas:

- searches for new physics in dilepton final states and interpretation of the results within beyond-Standard-Model scenarios (TeV-scale gravity, extended gauge models, dark matter models, theories with lepton number violation, etc.);
- searches for new physics in channels with two leptons/two b-quarks and missing transverse energy in the final state, testing beyond-SM predictions (searches for extended Higgs sector and dark matter candidates);
- exploration of Higgs boson properties and searches for new scalar bosons beyond the SM in decay channels to leptons and b-quark pairs;
- studies of Drell–Yan muon pair production processes to test SM predictions at the new energy scale, to measure the weak mixing angle, and to verify quark and gluon structure distribution functions;
- studies of QCD jet properties and refinement of fragmentation functions.

Starting in 2030, the LHC will operate in its high-luminosity phase (High Luminosity LHC, HL–LHC), reaching peak luminosities up to $5\text{--}7 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$. This upgrade will increase the accumulated statistics by more than an order of magnitude, with a projected integrated luminosity of $\sim 3000 \text{ fb}^{-1}$. During the third long shutdown (LS3, 2026–2029), the upgrade of the CMS detector is planned to ensure efficient operation of all CMS subsystems under HL–LHC conditions. The current project includes JINR obligations in participation in the construction of the High–Granularity Calorimeter (HGCAL) and upgrades of the Cathode Strip Chambers (CSCs) of the ME1/1 forward muon station of the CMS endcap muon system. During CMS operation period JINR obligation includes also maintenance and physical characteristics study of the CMS endcap detectors.

Expected results upon completion of the project:

Implementation of the physics research program at the CMS experimental setup with the design energy of proton beam interactions and integrated luminosity up to 500 fb^{-1} .

CMS detectors upgrade (in the framework of obligations) for operation under HL–LHC conditions.

Operations with the CMS Detector at the LHC, including commissioning and maintenance of the CMS hadron calorimetry and the forward muon station during data taking at high luminosity.

Expected results of the project this year:

Tests of the Standard Model predictions and search for new physics signals in the channel with a pair of muons or a pair of b-quarks with missing transverse energy in the final state based on processing and analysis of experimental data from RUN2 and RUN3 with total statistics corresponding to an integrated luminosity of up to 400 fb^{-1} , development of high-energy muon reconstruction algorithms and jet reconstruction algorithms.

Technical support for CMS detector systems, participation in the data taking and quality control of experimental data.

Development of software for a distributed system for data processing and analysis based on GRID technologies and ensuring data transfer between the JINR Tier-1/Tier-2 centers and CMS.

Upgrade of the ME1/1 Forward Muon Station detectors of the CMS endcap muon system for operation in the high-luminosity conditions of the HL-LHC collider.

Development of a test system for HGCAL calorimeter detectors. Participation in testing of the HGCAL planes with sensitive elements, assembly and commissioning of the calorimeter.

Experimental Tests of the Fundamentals of QCD

Theme leader: A.V. Guskov

Deputy: A.S. Zhemchugov

Participating countries and international organizations:

Belarus, CERN, China, Czech Republic, Germany, Israel, Italy, Japan, Poland, Portugal, Russia, United Kingdom, USA.

The problem under study and the main purpose of the research:

Quantum chromodynamics is a true theory of strong interaction. However, despite its considerable success in describing the interaction of quarks and gluons within the perturbative approach, the question of why hadrons and nuclei are as we see them remains open. Description of fundamental properties of hadrons, such as their masses, spins, parton distributions, form factors, spectra, etc., on the basis of fundamental principles of QCD is one of the main unsolved problems of quantum chromodynamics. Confinement of quarks and gluons in hadrons, as well as the growth of the running constant of strong interaction with decreasing characteristic scale of interaction energy does not allow direct use of the perturbative approach, which has proved itself at high energies. At present, various phenomenological models are used to quantitatively describe the hadron spectrum, static properties of hadrons, and their interactions at low energies. Certain success has been achieved in lattice calculations. A comparison of model predictions and theoretical calculations for observables with measurement results is an important test of the consistency and applicability limits of the approaches used. The ultimate goal of the research in this direction, both theoretical and experimental, is to obtain a description of the spectra, structure, and properties of hadrons from first principles of QCD.

Projects in the theme:

Name of the project	Project leaders	Project code
1. BESIII	I.I. Denisenko <i>Deputy:</i> A.S. Zhemchugov	02-2-1085-1-2007/2028
2. NA66 / AMBER Study of the fundamental properties of hadrons	A.V. Guskov	02-2-1085-2-2024/2029

Projects:

Name of the project	Project leaders	Implementation period
Laboratory Responsible from laboratories		Status
1. BESIII	I.I. Denisenko <i>Deputy:</i> A.S. Zhemchugov	2007-2028
DLNP	O.V. Bakina, I.P. Boyko, D.V. Dedovich, P. A. Egorov, D.A. Gubachev, A.V. Guskov, Yu.A. Nefedov	Implementation
BLTP	V.V. Bytyev	
MLIT	G.A. Ososkov, I.P. Pelevanyuk, V.V. Korenkov	

Abstract and scientific rationale:

The goals of the JINR group in the BESIII project are to study hadronic QCD spectra and search for exotic states, study the production and decays of Charmonium states, search for exotic Charmonium states and charmonium-like structures, and determine c-quark fragmentation functions. The JINR group's participation in the project involves data analysis and development of algorithms for event reconstruction in the BESIII detector using machine learning methods.

Expected results upon completion of the project:

The project will produce new knowledge about the properties of strong interactions on the $Q^2 \sim M_{J/\psi}^2$ scale. In particular, information will be obtained on the spectrum of exotic light and charmonium-like states and their properties, as well as on the details of inclusive c-quark production.

Expected results of the project this year:

BESIII data analysis. Development of offline software and analysis tools. Participation in the data taking.

2. NA66 / AMBER**A.V. Guskov**

2024-2029

Study of the fundamental properties of hadrons

Implementation

DLNP V.M. Abazov, G.D. Alexeev, N.V. Anfimov, A.I. Antoshkin, D.V. Dedovich, I.I. Denisenko, V.N. Frolov, A. Gongadze, A.O. Gridin, A.V. Guskov, N.A. Koviagina, I.V. Lyashko, A. Maltsev, B. Parsamyan, A.A. Piskun, A.S. Selyunin, S.S. Seryubin, N.I. Zhuravlev

VBLHEP V.A. Anosov, O.P. Gavrischuk, R. Gushterski, O.M. Kuznetsov, A.A. Shunko, E.V. Zemlyanichkina

Abstract and scientific rationale:

AMBER (Apparatus for Meson and Baryon Experimental Research) is a new experimental facility with a fixed target on the M2 beam line of the CERN SPS. The facility is designed to perform a variety of measurements aimed at addressing fundamental questions of quantum chromodynamics, which are expected to lead to a significant improvement in the understanding of QCD as a modern theory of strong interactions. The proposed measurements cover physics ranging from the smallest Q^2 values, such as determining the charge radius of a proton in elastic muon-proton scattering, reactions with moderate Q^2 values for hadronic spectroscopy, and studies of hadronic structure with high Q^2 using rigid Drell-Yan, Charmonium, and fast photon production processes. The JINR group is responsible for the modernization and operation of the HCAL1 hadron calorimeter and MW1 (Muon Wall 1) high-angle muon identification system. It is also involved, along with a group from the University of Turin, in the production and support of the Bulk Micromegas track detectors that will replace the obsolete multi-wire chambers (MWPCs) in the SAS behind the SM2 magnet.

Expected results upon completion of the project:

Solving the proton radius puzzle.

New knowledge of the quark and gluon structure of mesons.

Accurate knowledge of the yield of antiprotons in p-p and p-He processes, essential for the search for dark matter in astrophysical experiments.

Expected results of the project this year:

Participation in R&D for Micromegas detectors.

Data analysis for antiproton yield in p-He collisions and precision measurement of the proton radius.

Preparation of the front-end electronics upgrade to be able to operate in the triggerless mode.

Upgrade of the MW1 muon system.

Research on Relativistic Heavy and Light Ion Physics Experiments at the Accelerator Complex Nuclotron-M/NICA at JINR and CERN SPS

Theme leaders: A.I. Malakhov
S.V. Afanasiev

Participating countries and international organizations:

Armenia, Belarus, Bulgaria, China, India, Italy, Kazakhstan, Mongolia, Romania, Russia, Slovakia, Uzbekistan.

The problem under study and the main purpose of the research:

Study of new phenomena in multiple particle productions associated with the manifestation of the quark and gluon degrees of freedom in the interaction of relativistic nuclei. Study of nucleon and nuclear interactions at the VBLHEP accelerator complex, CERN SPS. Energy scan of interactions of nuclei at 20-158 GeV/nucleon energies and the study of their dependence on the atomic number of nuclei. The search for the critical point on the phase diagram of nuclear matter at the NA61/SHINE (SPS, CERN). Study of hadron production in hadron-nucleus interactions. Use of the obtained data for the precision calculations of neutrino spectra and fluxes in the accelerator experiments to study the neutrino oscillations. Investigation of nucleon clustering and the contribution of unstable nuclear-molecular States to the dissociation of light stable and radioactive isotopes, as well as the properties of rarefied baryonic matter in the dissociation of heavy nuclei. Experimental and theoretical study of deep subthreshold, cumulative processes, the formation of hadrons and antimatter in the transition energy region. Investigation of processes in the region of large P_T ($P_T \geq 1$ GeV/c) in non-cumulative and cumulative kinematic regions at SPIN and FODS setups. Study of the behavior of elementary particles, nucleon resonances and nucleon fluctuations in nuclear matter on the SCAN spectrometer. Preparation of proposals of the experiments at the VBLHEP accelerator complex with the Nuclotron extracted beams and NICA Collider. Study of the short-range nucleon-nucleon correlations and the cluster structure of the nuclei using the beams of ions, polarized protons and deuterons at the internal target of the Nuclotron.

DLNP	G.I. Lykasov, V.V. Lyubushkin, B.A. Popov, V.V. Tereschenko	

Abstract and scientific rationale:

The main physics goals include: search for the second-order critical end-point in the temperature versus baryon-chemical potential phase diagram (looking for nonmonotonic behavior of critical point signatures, such as transverse momentum and multiplicity fluctuations, intermittency signal, etc., when system freezes out close to the critical point), study the properties of the onset of deconfinement (search for the onset of the horn, kink, step, and dale structures in collisions of light nuclei). In

recent years, the program has been extended by Pb+Pb collisions where the open charm production, as well as collective effects are studied. Based on the obtained results, few years ago NA61/SHINE introduced a concept of two onsets in nucleus-nucleus collisions at the CERN SPS energies: onset of deconfinement (beginning of QGP formation – collision energy threshold for deconfinement) and onset of fireball (beginning of formation of a large cluster which decays statistically – system-size threshold for creation of statistical system). The strong interactions program is based on beam momentum scans (13A-158A·GeV/c) with light and intermediate mass nuclei (from p+p to Xe+La).

Expected results upon completion of the project:

Data analysis of the NA61/SHINE experiment (SPS, CERN).

Studies of the birth of hadrons in hadron-nuclear interactions.

The study of the formation of charmed hadrons (mainly D-mesons) during the interaction of heavy ions in order to obtain new data on the average number of charmed quark-antiquark pairs and to understand the mechanism of the birth of open charm.

Obtaining data for precision calculation of neutrino spectra and fluxes in accelerator experiments for the study of neutrino oscillations.

Completion of the modernization of the TOF system.

Expected results of the project this year:

Processing and analysis of experimental data obtained at the NA61/SHINE installation on p+p, Be+Be, Ar+Sc, O+O, Pb+Pb collisions.

Conducting experimental studies on a beam of relativistic lead nuclei.

Investigation of anti-core formation in Ar+Ca and Xe+La collisions.

The study of the formation of enchanted hadrons in the interaction of heavy ions in order to understand the mechanism of the birth of an open charm.

2. SCAN-3

S.V. Afanasiev

2017-2027

Deputy:

D.K. Dryablov

Upgrade Preparation Data analysis

VBLHEP Yu.S. Anisimov, A.A. Baldin, B.V. Dubinchik, P.R. Kharyuzov, S.V. Kilchakovskaia, Yu.F. Krechetov, O.V. Kutinova, D.G. Sakulin, V.A. Smirnov, E.V. Sukhov, V.V. Ustinov, D.V. Ustinov, V. Vartik

Abstract and scientific rationale:

The project is aimed at studying highly excited nuclear matter formed in dA interactions. This state of matter is studied by observing the decay of the excited nucleus into a pair of energetic particles emitted at an angle close to 180° and with an energy resolution of 4–5 MeV. The physics programme includes the study of the η - and Δ -nuclei formation and the determination of binding energies and widths of quasi-bound states.

Expected results upon completion of the project:

Upgrade of the SCAN setup.

Analysis of the experimental data on the behavior of nucleon resonances and nucleon fluctuations in nuclei, on the search and study of properties of the bound state-meson in nuclear matter.

Expected results of the project this year:

Testing of a three-beam magnetic spectrometer SCAN.

Data taking on the internal beam of the nuclotron according to the scientific program of the project.

Analysis of experimental data.

Activities of the theme:

Name of the activity	Leader	Implementation period
Laboratory Responsible from laboratories		Status
1. BECQUEREL2023	P.I. Zarubin	2024-2027

Deputy:

A.A. Zaitsev

Upgrade Preparation Data analysis

VBLHEP D.A. Artemenkov, N.K. Kornegruttsa, M. Natarjan, P.A. Rukoyatkin, V.V. Rusakova

Abstract and scientific rationale:

The BECQUEREL experiment is aimed at solving topical problems in nuclear clustering physics. The used method of nuclear track emulsion (NTE) makes it possible, due to its unique sensitivity and spatial resolution, to study in a unified approach multiple final states arising in dissociation of relativistic nuclei. Progress in this direction relies on computerized microscopy.

Expected results upon completion of the activity:

Search and study of the Hoyle state and more complex nuclear-molecular States in the dissociation of light nuclei.

Analysis of the isotopic composition of the fragmentation of heavy nuclei.

Use of automated microscopes, as well as improvement of the NE technology.

Expected results of the activity this year:

Analysis of exposures to Xe (NICA/Nuclotron) and Kr (GSI) nuclei to study ^8Be decays and the Hoyle state and accompanying α -ensembles and search for the 4α -condensate.

Estimation of the parameters of accompanying neutrons.

Mastering identification by multiple scattering of He and H isotopes on a motorized microscope.

Search for ^8Be and ^9B isobar-analogue states in the ^9Be and ^{10}C exposures.

Mastering the identification of ensembles of stopped α -particles in the fragmentation of nuclei from the composition of the emulsion under the action of relativistic particles.

**2. Experiment FASA-3 for registration
of nuclear fragments**

S.P. Avdeev

2024-2027

Upgrade Preparation Data analysis

DLNP V.I. Stegaylov

FLNR E.M.Kozulin, O.V. Strelakovsky

VBLHEP H.U. Abraamian, Z.A. Igamkulov, V. Karach, L.V. Korniyushina, P.A. Rukoyatkin, Z.A. Sadygov

Expected results upon completion of the activity:

Analysis of the experimental data on the processes of the multiple emission of intermediate mass fragments on the beams of relativistic light ions using a 4π FASA-3 setup for the registration of nuclear fragments.

Performing data analysis to determine the mechanism of multifragmentation and to obtain new information about the nuclear phase transitions "liquid-fog" and "liquid-gas".

Investigation of properties of hot nuclei formed in the collisions of light relativistic ions with heavy targets.

Production of the detector system for the registration of the decay of hypernuclei.

Expected results of the activity this year:

Debugging of the QUARTUS CAEN program at the FASA spectrometer for registration of nuclear fragments.

Analysis of experimental data in the framework of statistical and dynamic models.

Preparation of a new project.

**3. Investigation with light and heavy ions
for applied research**

A.I. Malakhov

2024-2027

Realization Preparation Data taking

VBLHEP N.N. Agapov, Yu.S. Anisimov, A.A. Baldin, E.G. Baldina, D.K. Dryablov, M. Paraypan

Expected results upon completion of the activity:

Use of heavy and light ions for applied research.

Expected results of the activity this year:

Analysis of the results of irradiation of biological objects in accordance with Agreement of the JINR-BAS cooperation.

4. Upgrade of equipment the station of internal target of the Nuclotron	S.V. Afanasiev R.Yu. Kolesnikov	2024-2027
		Upgrade Data taking

VBLHEP Yu.S. Anisimov, D.K. Dryablov, B.V. Dubinchik, A.S. Kuznetsov, S.N. Kuznetsov, D.G. Sakulin, V. Vartik

Expected results upon completion of the activity:

Replacement of target operation control electronics from the KAMAK system to modern industrial standards.

Creating software for new electronics. Production of a target based on the carbon isotope ^{13}C .

Expected results of the activity this year:

Preparing the station for operation in the spring Nuclotron Run.

5. Test of the detectors for measurements and control the luminosity at the collider NICA	G.D. Milnov	2024-2027
		R&D Technical Proposal

VBLHEP K.U. Abraamyan, T.Y. Bokova, Z.A. Igamkulov, L.V. Korniyushina, I.I. Migulina, A.Z. Sadygov, Z.Y. Sadygov, V.I. Shokin

FLNP E.I. Litvinenko

Expected results upon completion of the activity:

Creation of a detector and development of algorithms for configuring beam reduction in the NICA collider.

Expected results of the activity this year:

Preparation of a technical project for luminosity measurement at the NICA collider.

Production of two planes for the luminosity measurement detector.

6. Study of the multiparticle correlations at modernized internal target station at Nuclotron	V.P. Ladygin	2024-2027
		Preparation Data taking

VBLHEP Yu.V. Gurchin, A.Yu. Isupov, V.A. Kireev, N.B. Ladygina, K.S. Volkova, A.I. Malakhov, S.G. Reznikov, A.A. Terekhin, A.V. Tishevsky, I.S. Volkov

Abstract and scientific rationale:

The study of multiparticle correlations is one of the ways to study the dynamics of nuclear-nuclear collisions. One of the goals of research on the internal target of the Nuclotron is to evaluate the contribution of short-range 2-nucleon correlations for C+A and Xe+A collisions.

Expected results upon completion of the project:

Experimental and theoretical research on the project program.

Expected results of the project this year:

Processing of experimental data obtained with a ^{124}Xe beam with an energy of 3 GeV/nucleon 3.8 GeV/nucleon.

7. Neutron-rich nuclei on the NICA complex	A.V. Butenko Y. Ts. Oganessian S.V. Afanasiev	2025-2027
		Project preparation

VBLHEP A.A. Baldin, D.K. Dryablov, S.V. Kilchakovskaia, R.Yu. Kolesnikov, O.V. Kutinova, A.S. Kuznetsov, A.I. Malakhov, D.G. Sakulin, V.A. Smirnov, E.V. Sukhov, V.V. Ustinov, D.V. Ustinov, V. Vartik

FLNR A.A. Bezbakh

Abstract and scientific rationale:

This project is a proposal to search for the formation of light neutron-rich nuclei, including ^{12}He , on beams of short-lived nuclei produced at the NICA accelerator complex. The identification of synthesized isotopes will be carried out by the decay products into a residual nucleus and secondary neutrons. The primary beam is planned to be formed on the internal target of the Booster, with further transfer to the nuclotron and output to the measuring pavilion at the experimental facility **FORTUNE** – (Facility fOr the Research Totally Unusual Neutron-rich Elements).

Expected results upon completion of the activity:

Development of an experimental program for the formation of neutron-rich at the NICA accelerator complex and its physical motivation. Determination of the yield of ^{12}Be isotopes in the reaction $^{12}\text{C}+^{124}\text{Sn}=^{12}\text{Be}+X$ on the internal target of the booster. The project preparation.

Expected results of the activity this year:

Determination of the yield of ^{12}Be isotopes in the reaction $^{12}\text{C}+^{124}\text{Sn}=^{12}\text{Be}+X$ on the internal target of the Nuclotron booster. The project preparation.

ALICE

Study of Interactions of Heavy Ion and Proton Beams at the LHC

Theme leader: A.S. Vodopyanov

Participating countries and international organizations:

Armenia, Austria, Azerbaijan, Brazil, Bulgaria, CERN, China, Croatia, Cuba, Denmark, Finland, France, Germany, Greece, Hungary, India, Indonesia, Italy, Japan, Malta, Mexico, Netherlands, Norway, Pakistan, Peru, Republic of Korea, Romania, Russia, Slovakia, South Africa, Sri Lanka, Sweden, Thailand, Turkey, United Kingdom, USA.

The problem under study and the main purpose of the research:

Experimental study of heavy ion interactions at relativistic and ultrarelativistic energies.

Project in the theme:

Name of the project		Project leader	Project code
Laboratory	Responsible from laboratories		Status
1. ALICE		A.S. Vodopyanov	02-1-1088-1-2010/2030
A Large Ion Collider Experiment at CERN LHC		Deputy: B.V. Batyunya	Realization

VBLHEP V.A. Arefiev, V.I. Astakhov, N.A. Baldin, D.N. Bogoslovski, A. Borissov, N.A. Burmasov, M.G. Buryakov, S.G. Buzin, S.C. Ceballos, R.A. Diaz, V.Kh. Dodokhov, A.A. Efremov, A.S. Galoyan, S.S. Grigoryan, N.V. Gorbunov, E.L. Kryshen, V.I. Lobanov, P.V. Nomokonov, I.A. Oleks, I.A. Ruffanov

Abstract and scientific rationale:

The completion of the publication on the 1D and 3-D femtoscopy analysis for KchKch pairs in Pb-Pb Collisions at 5.02 TeV.

The continuation of the 1D femtoscopy analysis for KchKch pairs in p-Pb collisions at 5.02 TeV with event-shape selection.

The continuation of the 1-D femtoscopy analysis for K+K- pairs in p-Pb collisions at 5.02 TeV.

The beginning of the Partial-wave analysis of central diffraction events in pp collisions at 5.36 and 13.6 TeV.

The application of the Thermal model to describe pT spectra and elliptic flow v_2 for different hadrons in OO and Ne-Ne collisions at 5.36 TeV.

The continuation of the ALICE GRID support in the JINR computing system.

The participation in the ALICE shifts and service tasks.

The preparation of publications and presentations on conferences. Participation in the maintenance and operation of the detector ALICE. Preparation of proposals for the modernization of the ALICE detector: Cherenkov radiation detector.

Expected results upon completion of the project:

Participation in the data analysis, preparation of scientific publications and talks on the conferences. Participation in the maintenance, operation and upgrade of the ALICE detector. Preparation of the technical proposal for the construction of the Cherenkov radiation detector.

Expected results of the project this year:

Participation in the data analysis. Preparation of the scientific publications and talks on the conferences. Participation in the maintenance and operation of the ALICE detector.

Formulation of the plans and tasks for the preparation of the technical project of Cherenkov radiation detector.

Activities of the theme:

Name of the activity		Leader	Implementation period
Laboratory	Responsible from laboratories		Status
1. Physical process simulation and data analysis		B.V. Batyunya	2026-2030
			Realization

VBLHEP A. Borissov, M.G. Burmasov, A.S. Galoyan, S.S. Grigoryan, E.L. Kryshen, A.V. Kuznetsov, K.P. Mikhaylov, E.P. Rogochaya, A.S. Vodopyanov

DLNP G.I. Lykasov

BLTP D. Blaschke, S.N. Nedelko, O.V. Teryaev

Abstract and scientific rationale:

Participation in the development of the ALICE scientific program and the processing and analysis of experimental data.

Expected results upon completion of the project:

Processing and analysis of experimental data on femtoscopy of charged kaons and ultraperipheral interactions in collisions of protons, nuclei and nuclei with protons.

Preparation of publications, reports at international conferences.

Expected results of the project this year:

Processing and analysis of experimental data on femtoscopy of charged kaons and ultraperipheral interactions in collisions of protons, nuclei and nuclei with protons.

Preparation of publications and reports at international conferences.

2. ALICE. Computing in the distributed environment-GRID A.S. Vodopyanov

2026-2030

Realization

VBLHEP B.V. Batyunya, E.P. Rogochaya, G.G. Stiforov

MLIT A.Sh. Petrosyan

Abstract and scientific rationale:

Processing and analysis of experimental data are carried out within the framework of the distributed computer network GRID of the ALICE collaboration. Modernization of equipment and software is carried out on a permanent basis. The LIT JINR Complex is part of the ALICE GRID.

Expected results upon completion of the project:

Maintaining the working state of the ALICE GRID part at JINR.

Expected results of the project this year:

Maintaining the working state of the ALICE GRID part at JINR.

**3. Cherenkov radiation detector A.S. Vodopyanov
V.Kh. Dodokhov
P.V. Nomokonov**

2026-2030

Projection

VBLHEP V.A. Arefiev, V.I. Astakhov, N.A. Baldin, D.N. Bogoslovski, M.G. Buryakov, S.G. Buzin, S.C. Ceballos, R.A. Diaz, A.A. Efremov, N.V. Gorbunov, E.L. Kryshen, A.V. Kuznetsov, V.I. Lobanov, I.A. Olex, I.A. Rufanov

Abstract and scientific rationale:

In connection with the need to improve forward detectors it is necessary to upgrade a system for reading signals from scintillating and quartz units of the forward subdetectors.

Expected results upon completion of the project:

Preparation of the technical proposal for the construction of the Cherenkov radiation detector.

Expected results of the project this year:

Formulation of tasks and plans for the preparation of the technical proposal of the Cherenkov radiation detector.

Study of Rare Charged Kaon Decays and Search for Dark Sector in Experiments at the CERN SPS

Theme leader: V.D. Kekelidze

Deputies: D.V. Peshekhonov
D.T. Madigozhin

Participating countries and international organizations:

Belgium, Bulgaria, Canada, CERN, Chile, France, Germany, Italy, Kazakhstan, Mexico, Romania, Slovakia, Spain, Switzerland, United Kingdom, USA.

The problem under study and the main purpose of the research:

Search for and study of rare kaon decays and CP violation processes. Search for rare events using beam-dump and missing energy techniques with CERN SPS secondary beams. Search for phenomena beyond the Standard Model. Construction and maintenance of detectors.

Projects in the theme:

Name of the project	Project leaders	Project code
1. NA62	V.D. Kekelidze <i>Deputy:</i> D.T. Madigozhin	02-1-1096-1-2010/2027
2. NA64	V.A. Matveev D.V. Peshekhonov	02-1-1096-2-2017/2031

Projects:

Name of the project	Project leaders	Implementation period
Laboratory Responsible from laboratories		Status
1. NA62	V.D. Kekelidze <i>Deputy:</i> D.T. Madigozhin	2010-2027
VBLHEP	A.N. Baeva, D. Baigarashev, V.V. Bautin, D.D. Emelyanov, T.L. Enik, V.P. Falaleev, S.R. Gevorgyan, V.N. Gorbunova, E.A. Gudkovsky, I. Kambar, D. Kereibay, A.M. Korotkova, N.A. Molokanova, I.A. Polenkevich, K.M. Salamatina, S.N. Shkarovsky	Data analysis

Abstract and scientific rationale:

Implementation of the NA62 Project allows to clarify the CP-violation problem, to measure precisely very rare charged kaon decay to charged pions and two neutrinos, to carry out a search for supersymmetric particles and their partners to observe physics beyond the Standard Model. In addition, the characteristics of rare kaon and hyperon decays will be improved. Straw-detectors of the NA62 high resolution magnetic spectrometer working in vacuum will be supported during experimental runs. Development of a new detector prototype based on straws with a smaller diameter will continue to use it at higher intensity of the beams. Software for simulation, data analysis and processing will be developed.

Expected results upon completion of the project:

Measurement of the rare decay of a charged kaon into a pion and two neutrinos with an accuracy of about 10%, which will make it possible to refine the parameters of the Cabibbo-Kobayashi-Maskawa matrix and will be a decisive test of the Standard Model.

In addition, the probabilities and other parameters of a number of rare decays of charged kaons will be measured, which will make it possible to refine the parameters of the Chiral Perturbation Theory, which describes strong interactions at low energies.

Expected results of the project this year:

NA62 data analysis will be carried out to measure the probability of decay of a charged kaon into a pion and two neutrinos, and to measure the characteristics of a number of rare decays.

System for detector calibration and event reconstruction will be upgraded; general software of the experiment will be developed.

Participation in the maintenance of the NA62 spectrometer, as well as in the development and maintenance of the control system for all detectors of the experiment.

Participation in the development of a straw detector for high intensity beams.

2. NA64	V.A. Matveev D.V. Peshekhonov	2017-2031	Preparation Data taking Data analysis
---------	----------------------------------	-----------	---

VBLHEP S.V. Gertsenberger, S.N. Gninenko, A.V. Ivanov, I. Kambar, G.D. Kekelidze, M.M. Kirsanov, V.A. Kramarenko, V.A. Polyakov, K.M. Salamatina, D.A. Shchukin, E.V. Vasilieva, P.V. Volkov, I.A. Zhukov

DLNP V.N. Frolov

BLTP N.V. Krasnikov, A.S. Zhevlakov

Abstract and scientific rationale:

Despite active searches for dark matter (DM) manifestations carried out at the LHC and in non-accelerator experiments, it still remains a great mystery. Another possibility is that in addition to gravity, the interaction between the dark sector and visible matter could occur via a new vector boson A' (dark photon). This has spurred theoretical and experimental efforts to search for manifestations and interaction portals between the visible and dark sectors, shifting the strategy from high-energy to high-intensity approaches.

The NA64 experiment is a fixed-target experiment at the CERN SPS. The NA64 setup is a hermetic detector designed to search for dark sector (DS) manifestations by detecting missing energy events in the scattering of electrons/positrons, hadrons, and muons on nuclei.

Expected results upon completion of the project:

The main aim of the NA64 project is the search for the new physics beyond the SM, namely the search on the secondary CERN SPS electron and muon beams of the dark photon (A') and hypothetical 16,7 MeV boson as well as other dark sector manifestations.

Expected results of the project this year:

Analysis of data obtained during the runs of 2024–2026.

Participation in the development of mathematical software for online data analysis, event simulation and reconstruction in experimental facility setups.

Preparation for the upgrade of the experimental facility:

Upgrade of the electromagnetic calorimeter of the NA64e setup; preparation for the upgrade of the hadron calorimeter for operation with the muon beam, jointly with groups from Zurich and Padua; development of a laser monitoring system for the calorimeters, jointly with groups from Genoa and Bologna.

Participation in the development of the facility's tracking system and the upgrade of DAQ; development of a hadron beam guard system, jointly with a group from Chile.

Development of Advanced Detectors and Analysis Methods, Hadronic and Rare Leptonic Processes

Theme leader: Yu.I. Davydov

Participating countries and international organizations:

Azerbaijan, Belarus, China, Italy, Japan, Russia, Switzerland, USA, Uzbekistan.

The problem under study and the main purpose of the research:

Precise determination of the Higgs boson properties and search for new physics phenomena beyond the Standard Model using Monte Carlo generators with full simulation of the detector's signal and background events at the CEPC.

Development of new detectors for use in the CEPC conditions and methods for their calibration.

Projects in the theme:

Name of the project		Project leaders	Project code

Abstract and scientific rationale:

The discovery of the Higgs boson at the LHC marked the beginning of a new era in high-energy physics. The proposed 100 km-circumference Circular Electron-Positron Collider (CEPC) program in China aims to make unprecedentedly precise measurements of the Higgs boson, test the predictions of electroweak theory, flavor physics, QCD, and explore new physics beyond the Standard Model (BSM).

The objectives of this project are to prepare proposals for a programme of research into the properties of Higgs bosons, study their exotic decays and search for new BSM physics phenomena, participate in software development, and perform a series of studies of new detectors for further use in experiments at the CEPC.

Expected results upon completion of the project:

Study of $e^+e^- \rightarrow ZX$ processes for precise determination of properties of the Higgs bosons, study of their exotic decays and search for new BSM physics phenomena using Monte Carlo generators. Theoretical support in the development of a physics programme, creation of modern Monte Carlo simulation tools, assessment of the collider luminosity.

Creation and research of prototypes of detector systems, development of methods for their calibration based on the particle flow algorithm.

Expected results of the project this year:

Estimation of cross sections and observation potential of processes with the production of dark matter particles χ in the model with the extended Higgs sector 2HDM+a, in particular the processes $e^+e^- \rightarrow Zh_{125} \rightarrow l^+l^- + 2a$, $a \rightarrow \chi\chi$ at energies of 240

and 360 GeV at CEPC and FCC-ee.

Release of a new version of the ZFITTER computer program, including higher-order radiative corrections due to radiation from the initial state. Numerical analysis of the effects with allowance for these corrections under experimental conditions at the CEPC and FCC-ee colliders.

Analysis of the Balitsky-Fadin-Kuraev-Lipatov effects of evolution in QED and the construction of corresponding theoretical predictions for their observation at CEPC and FCC-ee.

Study of the radiation resistance of electromagnetic and hadron calorimeter components. Development of prototypes of a muon detector and electromagnetic and hadron calorimeters and study of their parameters.

Activities of the theme:

Name of the activity		Leader	Implementation period
Laboratory	Responsible from laboratories		Status
1. Mu2e		Yu.I. Davydov	2024-2027
			R&D Realization
DLNP	A.M. Artikov, N.V. Atanov, O.S. Atanova, V.Yu. Baranov, A.V. Boikov, V.V. Glagolev, I.A. Suslov, I.I. Vasilyev, I.Yu. Zimin		
BLTP	G.A. Kozlov		

Abstract and scientific rationale:

The Mu2e experiment is aimed at searching for a process with lepton number violation for charged leptons $\mu^- N \rightarrow e^- N$, which is a coherent conversion of a muon into an electron in the field of a nucleus. At the non-zero neutrino mass this process is possible but remains unobservable, since the probability is proportional to $(\Delta m_{ij}^2/M_W^2)^2$, where Δm_{ij}^2 is the difference between the squares of the masses of the eigenstates of the i th and j th neutrinos, and M_W is the mass of the W boson. The predicted probability for the process $\mu^- N \rightarrow e^- N$ is $\sim 10^{-50}$. This process is a theoretically perfect target for new physics searches. In many new physics models that include massive neutrinos, the probabilities of these processes significantly increase and become observable.

Expected results upon completion of the activity:

The data collection will be carried out in two runs with a two-year interval. In the first run it is planned to collect 6×10^{16} stopped muons. In the absence of $\mu^- \rightarrow e^-$ conversion events, a new limit on this process will be set at $R_{\mu e} < 6.2 \times 10^{-16}$ (90% CL), which is three orders of magnitude lower than the current limit $R_{\mu e} < 7 \times 10^{-13}$ (90% CL) set by the SINDRUM II experiment.

In the second stage of the data collection, it is planned to lower the limit on $\mu^- \rightarrow e^-$ conversion by another order of magnitude.

Expected results of the activity this year:

Participation in the development of software for muon beam data analysis. Remote participation in data collection using cosmic muons and the muon beam at the end of 2027.

2. MEG II	N.V. Khomutov	2024-2027
		Realization Data taking Data processing
DLNP	N.P. Kravchuk, V.L. Malyshev, A.M. Rozhdestvensky	

Abstract and scientific rationale:

The Standard Model (SM) of particle physics predicts a vanishingly small probability ($< 10^{-50}$) of processes violating the conservation of the lepton number for charged leptons. Therefore, the detection of such processes is an absolute indication of the presence of new physics beyond the SM, and their absence imposes a limitation on theories beyond the SM. The decay $\mu^+ \rightarrow e^+ \gamma$ is especially sensitive to such new physics. The MEG II experiment is the second phase of the MEG experiment to search for the decay $\mu^+ \rightarrow e^+ \gamma$ on the high-intensity (7×10^7 muons/s) beam of the HIPA accelerator at PSI (Switzerland). Thanks to a deep modernization of the facility, it is planned to improve the record upper bound for the decay probability obtained earlier in the first phase of the experiment by approximately an order of magnitude.

Expected results upon completion of the activity:

Processing of the full data set collected in 2021–2026. If the $\mu^+ \rightarrow e^+ \gamma$ decay is not detected, the existing constraint on the decay probability $B(\mu^+ \rightarrow e^+ \gamma) < 4,2 \times 10^{-13}$ (90% C. L.) will be improved to a level of $\sim 6.0 \times 10^{-14}$.

Expected results of the activity this year:

Completion of experimental data collection at the MEG-II facility and the beginning of processing the full data set collected in 2021–2026. Publication of intermediate results.

Strangeness in Hadronic Matter and Study of Inelastic Reactions Near Kinematical Borders

Theme leaders:
E.A. Stokovsky
E.S. Kokoulina
D.O. Krivenkov

Participating countries and international organizations:
Belarus, Cuba, Egypt, India, Israel, Russia, Slovakia, USA.

The problem under study and the main purpose of the research:

Strangeness in hadronic matter and study of boundary effects:
study of stabilizing effects of strangeness in nuclear matter and properties of the lightest hypernuclei; study of multi-particle dynamics in the inelastic proton-proton and proton-nucleus interactions with extremely high multiplicity; study of spectra and yields of soft photons in the deuteron-nucleus and nucleus-nucleus interactions; determination of hadronization parameters at NICA energy at the SPD facility; study of Short-Range Correlated (SRC) pairs of nucleons.

Project in the theme:

DLNP	B.A. Popov, S.V. Tereschenko, V.V. Tereschenko		
OCE	A.N. Parfenov		

Abstract and scientific rationale:

The study of properties of the lightest hypernuclei is relevant, has high significance and the Nuclotron beam is suitable place to investigate these tasks. The study of properties of light neutron-rich hypernuclei is of great interest, first of all, to clarify the theory of the intranuclear nucleon-nucleon interactions: the neutron halo, ΛN interaction including $\Lambda N - \Sigma N$ conversion and the spin-dependent ΛN interaction etc. The special interest to this investigation is because of absence of reliable data on ${}^6_{\Lambda}\text{H}$ properties and theoretical predictions that are strongly depend on model and controversial. Simultaneously, the lifetimes and production cross sections of ${}^4_{\Lambda}\text{H}$ and ${}^3_{\Lambda}\text{H}$ will be studied in the same experiment. The end measurements can be used as "reference points" to confirm the production and decay of ${}^6_{\Lambda}\text{H}$.

Expected results upon completion of the project:

Experimental conclusion about the existence of the hypernucleus ${}^6_{\Lambda}\text{H}$.

New experimental data on the properties of the lightest hypernuclei and experimental verification of corresponding theoretical models for these hypernuclei.

New experimental data on the drip-line location for loosely bound light hypernuclei with high neutron excess, necessary for the development of the theory of neutron-rich hypernuclei and models of their production in non-central nucleus-nucleus interactions.

New experimental data on the production of strangeness and vector mesons (including those, containing strange quarks) by polarized photons (close to the relevant thresholds).

Universal spectrometer for users of the Nuclotron beams.

Expected results of the project this year:

Restoration of overall operability of the 4B channel in building 205 VBLHEP.

A test run on light nuclei to check the beam line 4B and the HyperNIS spectrometer. Data taking for ${}^6_\Lambda\text{H}$ search using beam of ${}^7\text{Li}$ nuclei. Analysis of the first experimental data for the ${}^6_\Lambda\text{H}$ search and for the measurements of hyperhydrogen isotopes ${}^6_\Lambda\text{H}$ and ${}^4_\Lambda\text{H}$ lifetimes.

Upgrade of the HyperNIS magnetic spectrometer (tracking system) by adding the planes of GEM detectors. These detectors, which have already been (partially) purchased and are being tested at the HyperNIS setup by staff, will be integrated into this setup to improve accuracy of the hypernucleus decay vertex determination. MC for the optimal geometry of joint (HyperNIS and SRC experiments) detectors. Data acquisition system upgrade. Production and installation of a new time-of-flight detector (RPC).

Within the collaboration with Japan: data taking at LEPS/LEPS2 setups on the production of strangeness and vector mesons (including those, containing strange quarks) by polarized photons (close to the relevant thresholds); analysis of data on such reactions, taken before.

DLNP V.V. Tereschenko, Yu.N. Usikov

BLTP A.B. Larionov

Abstract and scientific rationale:

The properties of nuclei are defined by interaction of their constituents: nucleons on the level of lower resolution and quarks and gluons at high resolution. The relation between these two descriptions remains a challenge. Short-Range Correlated (SRC) pairs of nucleons, which are temporary fluctuations of strongly interacting nucleons at a distance of around nucleon radius and individual momenta larger than that of mean-field nucleons, are coupled to both nuclear scales. Electron scattering experiments have shown the far-reaching impacts SRCs have on the many-body systems, the nucleon-nucleon interaction, and nucleon substructure.

Expected results upon completion of the project:

The next experiment being planned right now will involve the use of a tensor polarized deuteron beam from Nuclotron and existing detection equipment at LHEP JINR. Specifically, we will explore polarized deuteron hard scattering off a liquid hydrogen target, with a focus on SRC kinematics. With a polarized deuteron beam of 6 GeV/c/nucleon momentum we will select interactions with $|t, u| > 1 \text{ (GeV/c)}^2$, and a center-of-mass scattering angle around 90 degrees. A coincidence between the two arms of a dedicated spectrometer will identify two protons resulting from the $p(d,2p)n$ reaction. Simultaneous detection of the recoil partner neutron arising from the deuteron's hard breakup will also be possible. The two-arm spectrometer will be akin to the one used in the 2022 SRC/BM@N measurement. Detection of the recoil neutron will necessitate the incorporation of a neutron detector along the beam. It is important to note that the installation of the required detection systems for planned measurements in the HyperNIS experimental area will not disrupt the existing HyperNIS experimental setup. However, a larger band by the magnetic field is needed to obtain the required resolution. For that a second magnet needs to be installed. Another solution is creating a new analyzing magnet instead of the installed one.

Expected results of the project this year:

SRC at BM@N data analysis.

Estimation of the momentum resolution of the HyperNIS magnetic spectrometer in the perspective of solving the problems of the SRC experiment.

Development of the TDR for SRC setup at the HyperNIS experimental area.

Abstract and scientific rationale:

In high energy physics, events are usually analyzed for which the deviation from the average multiplicity does not exceed two average values. Events with a higher multiplicity occur extremely rarely, so it is difficult to collect large statistics for them, in addition, there are difficulties in processing them. When planning any experiment, simulations are performed, but despite the fact that the number of Monte Carlo generators increases every year, their predictions deviate significantly in the region of high multiplicity. Setting their parameters at the given energy stops working when moving to a higher energy. All this indicates a significant misunderstanding of the mechanism of multiple production. The study of events with the production of a large number of secondary particles will allow a deeper understanding of strong interactions, including the hadronization stage.

In the region of high multiplicity, a series of collective phenomena with a quantum nature are predicted, such as the formation of a pion (Bose- Einstein) condensate, an excess soft photon (less than 50 MeV) yield, Cherenkov radiation of quarks, and others. In this region, the longitudinal component of the momentum approaches the transverse component, reaching it. This indicates the disappearance of the leading effect, and in the same region, apparently, the formation of a condensate begins. These collective phenomena can be studied using the NICA/SPD facility.

This project is aimed at studying the gluon component of the nucleon. The study of processes with high multiplicity in the model of gluon dominance developed at JINR will provide additional knowledge about the gluon component of the nucleon and its contribution single-spin asymmetry, AN to hadronization.

Experimental data obtained with polarized beams contain unique information about strong interactions, which is important for understanding the confinement mechanism, the origin of quark and hadron masses, and the origin of polarization effects themselves. One model explaining a number of polarization phenomena in quantum chromodynamics, including the nature of single-spin hadron asymmetries, is the quark chromomagnetic polarization (QMP) model, developed by V.V. Abramov (NRC Kurchatov Institute). According to this model, spectator quarks and sea quarks are responsible for the emergence of single-spin asymmetries.

The BRAHMS experiment at the RHIC collider, BNL, measured the single-spin asymmetry AN in $p\uparrow p$ collisions for inclusive production of π^+ and π^- mesons. A significant increase in AN (almost twofold) was found in the region of increased multiplicity. The developing gluon dominance model (GDM) will help elucidate how this increase is influenced by increasing multiplicity. According to GDM, the source of high multiplicity is the gluon component; unlike Abramov's COD model, this component precedes the formation of quarks in the "sea". Its fragmentation into quark-antiquark pairs creates an elevated chromomagnetic field strength. A description of the dynamics of multiple production in proton collisions within the MHD framework allows for the quark-gluon cascade stage, described by QCD perturbation theory and supplemented by a hadronization stage based on experimental data. Studying these processes will advance our understanding of the growth of single-spin asymmetry in the region of increased multiplicity in both hadronic and nuclear interactions.

Expected results upon completion of the activity:

Preparation of a physics program for the study of collective phenomena in the region of high multiplicity in proton and deuterium interactions at the SPD facility at the NICA collider.

Development of the gluon dominance model for the collective behavior study of secondary particles in high multiplicity events at the energies of the future NICA collider at the SPD facility. Estimates of the contribution of gluon bremsstrahlung by quarks and gluon fission as dominant elementary QCD processes in this region. Estimates of hadronization parameters for different kinds of hadrons.

Expected results of the activity this year:

Complete the study of the behavior of quark and gluon jets, as well as the hadronization stage during e^+e^- annihilation in the accessible energy range. Calculate the factorial moments, F_k , factorial cumulants, K_k , and their ratios, $H_k = K_k / F_k$, for gluon and hadron number distributions up to rank 4-5 and higher in the range from 9.4 to 189 GeV. Plot graphs of their energy dependence. Based on the analysis of their behavior, draw conclusions about changes in the multiple production mechanism at

the quark-gluon stage and the final hadron production stage. Obtain preliminary indications of the influence of the gluon component on the growth of single-spin asymmetry. Consider the multiple production mechanism for the manifestation of polarization phenomena in the high-multiplicity region.

Study of Polarization Phenomena and Spin Effects at the JINR Nuclotron-M/NICA Facility

Theme leader: V.P. Ladygin

Deputies: N.M. Piskunov
E.A. Strokovsky

Participating countries and international organizations:

Belarus, Bulgaria, France, Japan, Romania, Russia, Slovakia, Sweden, United Kingdom, USA.

The problem under study and the main purpose of the research:

Polarization studies are undoubtedly relevant now. They combine the efforts of JINR Laboratories and many foreign laboratories, both participating and non-participating countries, in the design and conduct of experiments using unique beams of polarized deuterons with energies ranging from 5 MeV per nucleon to 5.6 GeV/n, secondary beams of polarized protons and neutrons, as well as beams of polarized protons directly accelerated in the Nuclotron. The possibility of obtaining beams of accelerated polarized protons in the Nuclotron without significant investment, demonstrated in 2017, became the basis for intensifying work on the spin program of the NICA project and, in particular, for the development of polarimetry techniques, the creation of new methods for precise control of the direction of the spin of protons, deuterons and other particles. This part of the work on the topic is directly related to the creation of the NICA complex and the testing of a new approach to controlling the polarization in the spin transparency mode. Of undoubted interest is also the study of the possibility of setting up experiments at the upgraded Nuclotron and the collider to measure EDM and parity violation. Within the framework of the theme, two projects are being carried out: ALPOM-2 and DSS. Preparation of the project on the systematic study of spin effects in the processes of production of strange baryons and vector mesons in elementary reactions and in cold dense nuclear matter at Nuclotron energies using beams of polarized and unpolarized particles on a fixed target and a wide-aperture magnetic spectrometer. Taking into account the presence of polarized beams, new experimental data will be obtained on the study of charge-exchange processes, on the study of the structure of 2- and 3-nucleon correlations in the reactions of deuteron-proton elastic scattering and deuteron breakup, by measuring of the vector and tensor analyzing powers in the deuteron core region, as well as other processes that are important for the development of the theoretical models describing the interactions of the simplest nuclear systems with allowance for relativism and the contribution of the meson and quark-gluon components of the internal motion of constituents in nucleons.

Abstract and scientific rationale:

At present, it is necessary to measure the analyzing powers of protons and neutrons in scattering on CH₂, CH and other targets. Such data are necessary for experiments requiring measurements of the polarization of protons and neutrons in nuclear reactions. It is also necessary to optimize hadronic polarimetry and expand the database on analyzing powers both for

protons, the same for neutrons. This is possible only in Dubna, where polarized proton beams and neutrons obtained by fragmentation of accelerated polarized deuterons.

Expected results upon completion of the project:

Investigation of the analyzing powers in the scattering of polarized protons (at momenta up to 7.5 GeV) and neutrons (at momenta up to 6 GeV) on polyethylene at the ALPOM-2 installation.

Expected results of the project this year:

Performance of the first measurements on beams of polarized nucleons.

Abstract and scientific rationale:

Study of the structure of 2- and 3-nucleon correlations in the reactions of deuteron-proton elastic scattering and deuteron breakup by measuring of the vector and tensor analyzing powers in the region of the deuteron core, as well as other processes important for the development of theoretical models describing the interactions of the simplest nuclear systems, taking into account relativism and the contribution of the meson and quark-gluon components of the internal motion of constituents in nucleons.

Expected results upon completion of the project:

Measurement of the structure of 2- and 3-nucleon correlations in deuteron-proton elastic scattering and nonmeson deuteron breakup in the experiments at the Nuclotron internal target.

Measurement of cross sections and analyzing powers of these reactions. Performing experiments on the deuteron and proton spins manipulation, development of the polarimetry at the Nuclotron internal target.

Obtaining of the experimental data on many-particle correlations in nucleus-nucleus interactions.

Expected results of the project this year:

Completion of the analysis of data on the analyzing powers A_y , A_{yy} and A_{xx} of the deuteron-proton scattering at 400-1800 MeV. Continuation of the analysis on the many-particle correlations in the Xe+W interaction.

Taking of new data using polarized deuteron and proton beams at the Nuclotron internal target.

Publication of the results obtained on the polarimetry, on the deuteron analyzing powers in deuteron-proton elastic scattering and many-particle correlations in nucleus-nucleus interactions.

MLIT O.V. Derenovskaya, N.N. Voytishin

BLTP A.N. Isadykov, G.Yu. Prokhorov, O.V. Teryaev, A.S. Zhevlakov

Abstract and scientific rationale:

Data on the production of vector mesons obtained in different reactions at BNL, KEK and GSI show strong absorption of mesons in the nuclear medium, as well as changes in their masses and widths. A new important observable is the spin alignment of vector mesons and the dependence of its magnitude on the properties of dense matter. The increase in global polarization values of hyperons measured at BNL with decreasing energy of colliding nuclei also requires further experiments at Nuclotron energies. The goal of the new project is the systematic study of the spin effects in the processes of production of strange baryons and vector mesons in elementary reactions and in cold dense nuclear matter at Nuclotron energies using beams of polarized and unpolarized particles at a fixed target and a wide-aperture magnetic spectrometer.

Expected results upon completion of the activity:

Monte Carlo simulations will be performed using different event generators for the main physical processes in the Nuclotron energy range in fixed target kinematics for various colliding systems.

A plan for setting up the experiment with detector systems will be prepared, the required accuracy of signal recording and the possibility of the physical signal selection from the background will be assessed.

Test work will be carried out to develop and to manufacture promising detectors and readout electronics systems for them.

A letter of intent, conceptual and technical designs for a fixed target experiment with extracted and secondary beams of the Nuclotron, aimed at studying the properties of cold baryonic matter, including spin and polarization effects, will be prepared.

Expected results of the activity this year:

Monte Carlo simulation of nucleon-nucleon and nucleon-nucleus collisions at Nuclotron energies, comparison with existing experimental results obtained previously at BNL, CERN and GSI.

Development of the detector concept for the implementation of the proposed experimental program.

**3. Experiments on the program STRELA
at polarized deuteron beam**
N.M. Piskunov

Abstract and scientific rationale:

Performance of the experimental works on the charge exchange reaction measurements using polarized deuteron beam in the Nuclotron energy range.

Expected results upon completion of the activity:

Carrying out measurements on beams of polarized and unpolarized deuterons in the range from 3 to 6 GeV/c.

Expected results of the activity this year:

Preparation of the STRELA detectors for the first measurements in experimental zone in the focus of F5 of the VP-1 beamline of building 205.

4. Theoretical calculations of polarized processes V.K. Lukyanov (BLTP)

2027-2028

Data analysis

VBLHEP A.P. Ierusalimov, N.B. Ladygina

Abstract and scientific rationale:

Development of theoretical models describing the structure of light nuclei and the interactions of the simplest nuclear systems, taking into account relativism and the contribution of the nucleon-meson and quark-gluon components to the internal motion of constituents in nucleons.

Expected results upon completion of the activity:

Description of experimental data on cross sections and polarization observables in reactions involving light nuclei, including those obtained at the Nuclotron/NICA accelerator complex.

Expected results of the activity this year:

Description of experimental data on deuteron analyzing powers of deuteron-proton elastic scattering at intermediate energies.

Analysis of polarization observables in pion production reactions in nucleon-nucleon collisions at Nuclotron energies.

Fundamental and Applied Physics Research with Relativistic Particle Beams

Theme leader: A.A. Baldin

Participating countries and international organizations:

Armenia, Belarus, Chile, Mongolia, Russia.

The problem under study and the main purpose of the research:

It is planned to develop fundamental and applied fields of experimental research with beams of relativistic particles, including the accelerator complex NICA at the Test Zone of the SPD experiment (experimental facility MARUSYA), experiments at the front part of the extraction channel of the Nuclotron to the F3 focus, as well as with beams of the LINAC-200 (800) electron accelerator, microtron (LNR), IREN facility (LNP) in the framework of the new collaboration FLAP (Fundamental&applied Linear Accelerator Physics collaboration), namely, investigation of the mechanisms of electromagnetic interactions and new applications involving the creation of neutron sources, controllable generation of various types of electromagnetic radiation using relativistic electrons, development of new methods of charged particle beam diagnostics, testing and calibration of detectors of particles and radiations for collider and other accelerator experiments.

Abstract and scientific rationale:

It is planned to develop the fields of research at which the new collaboration FLAP (Fundamental & applied Linear Accelerator Physics collaboration) is focused, namely, investigation of the mechanisms of electromagnetic interactions and new applications, including the creation of neutron sources, controllable generation of various types of electromagnetic radiation, such as diffraction Cherenkov and THz radiation in a range from 1 to 10 THz by relativistic electrons. Development of the new methods of charged particle beam diagnostics, testing and calibration of particle and radiation detectors for collider and other accelerator experiments, including the creation of time-of-flight calibrated beams of secondary neutrons with energies from thermal to 20 MeV.

Expected results upon completion of the project:

The main global results of the project will be:

- creation of a unique scientific-research installation for investigation of the mechanisms of generation of electromagnetic radiation in a wavelength range from 1 mm (microwave range) to 1 pm (g radiation) at interaction of relativistic electron beams with matter and external electromagnetic fields;
- development of fundamentally novel approaches to generation of electromagnetic radiation with controllable parameters based on the application of targets from functional materials;
- development of new nondestructive methods of charged particle beam diagnostics;

- development, testing and calibration of charged particle detectors and radiations for NICA SPD and MPD experiments;
- radiobiological studies with accelerated electron beams and secondary γ quanta and neutrons;
- development of a pulsed neutron source with known parameters for investigations in the field of extreme states of matter;
- experiments on the search of hypothetical particles beyond the Standard Model.

Expected results of the project this year:

Creation and beam testing of particle detectors based on fast scintillator.

Registration of GHz and THz radiation from active targets irradiated by relativistic electron beams.

Creation of the time of flight test bench for registration of secondary neutrons.

Testing of stilbene-based scintillators for $n - \gamma$ separation.

Testing of new neutron detectors based on microchannel plates and nanosized boron-10 samples for high spatial resolution neutronography.

Activities of the theme:

Name of the activity	Leaders	Implementation period
Laboratory Responsible from laboratories		Status
1. Processing, digitizing, and analysis of primary experimental information (films) obtained using bubble chambers	A.A. Baldin E.A. Klevtsova	2025-2027
		Data analysis
VBLHEP	S.G. Arakelyan, E.G. Baldina, A.V. Beloborodov, A.V. Belyaev, Ver.V. Bleko, Vit.V. Bleko, D.N. Bogoslovsky, E.A. Bushmina, E.A. Klevtsova, S.A. Chetverikov, D.S. Korovkin, N.E. Kukharev, A.V. Pavlyuk, V.A. Pukhaeva, O.V. Rogachevsky, N. Sagimbaeva, A.B. Safonov, A.Yu. Troyan, Yu.A. Troyan	
MLIT	E.K. Kuz'mina, M.M. Pashkova, V.S. Rikhvitsky, V.S. Semashko, S.V. Semashko, Yu.V. Trofimov	

Abstract and scientific rationale:

Continuation of filling in the experimental data base on multiple particle production in an energy range from 1 to 300 GeV obtained in experiments with bubble chambers.

Analysis of experimental data in the intermediate energy range in relativistic physics based on the self-similarity approach and application of the properties of Lobachevsky geometry for description of multiple particle production.

Search and study of new phenomena in the conditions of registration of «soft processes» of particle production with high spatial and momentum resolution which is unavailable in modern electronic experiments.

Expected results at the end of the activity:

Creation of the required equipment for digitizing of experimental film information obtained using bubble chambers and in fixed-target electronic experiments in the conditions of registration of multiple particle production in an energy range of 1-300 GeV.

Preparation of the educational program for students qualifying for the NICA project.

Comparison of the results obtained using the bubble chambers and the simulations with modern models. Development of recommendations for the strategy of experimental research at the accelerator complex NICA.

Publication of the results of analysis of bubble chamber data.

Expected major results in the current year:

Creation of the electronic data base from scanned photofilms and processes stereo images.

Organization of the procedure of storage and processing of the obtained images using the JINR MLIT capacities.

More precise determination of the results obtained using the 2-m and 1-m hydrogen bubble chambers.

2. Investigation of deep subthreshold processes applied and educational programs at MARUSYA facility	A.A. Baldin D.S. Korovkin	2025-2027
		Preparation Data taking

VBLHEP	S.V. Afanasiev, V.A. Arefiev, E.V. Arkhipov, V.I. Astakhov, E.G. Baldina, S.N. Bazylev, A.V. Beloborodov, A.I. Berlev, Ver.V. Bleko, Vit.V. Bleko, D.N. Bogoslovskii, E.A. Bushmina, S.A. Chetverikov, P.R. Kharyuzov, V.A. Kukharev, A.V. Pavlyuk, A.B. Safonov, S.Yu. Starikova, A.P. Sumbaev, A.Yu. Troyan, Yu.A. Troyan
BLTP	S.G. Bondarenko
MLIT	V.V. Korenkov, E.K. Kuz'mina, M.M. Pashkova, S.V. Semashko, V.S. Semashko
DLNP	A.N. Fedorov, G.D. Alekseev

Abstract and scientific rationale:

Experimental studies of deep subthreshold and cumulative reactions at extracted beams of Nucltron-N (SPD Test Zone, MARUSYA facility).

Performing correlation experiments with registration of groups of particles in the final state with one cumulative particle. Studies in the pre-cumulative and cumulative regions with extracted polarized beams.

Expected results at the end of the activity:

New experimental data on A-dependences of rare subthreshold and cumulative processes of pion, kaon, and light nuclei production depending on the type and energy of projectile nuclei, momentum and angle of registered particles.

New upgraded facility supplemented with detectors for correlation experiments: multichannel gamma spectrometer, multiplicity detector, neutron detector.

Expected major results in the current year:

Putting in operation the upgraded magneto-optical channel of the MARUSYA facility.

Reconstruction of the experimental zone of the spectrometer channel at F4.

Creation of the new data acquisition system of the facility.

Putting in operation track detectors.

Development and creation of the neutron detector.

Testing of the Cherenkov detector.

Testing of the prototype detectors for the SPD experiment.

Continuation of experiments at extracted beams of Nuclotron-N with maximum available intensity.

Development of the software for simulation and processing of experimental data.

3. Neutron resonance spectroscopy

**A.A. Baldin
V.N. Shvetsov**

2025-2027

Preparation Data taking

VBLHEP	E.V. Arkhipov, V.I. Astakhov, E.G. Baldina, A.V. Beloborodov, Ver.V. Bleko, Vit.V. Bleko, E.A. Bushmina, S.A. Chetverikov, P.R. Kharyuzov, D.S. Korovkin, V.A. Kukharev, A.V. Pavlyuk, M.Yu. Petrov, A.B. Safonov, S.Yu. Starikova, A.P. Sumbaev, Yu.A. Troyan
MLIT	S.V. Semashko, Yu.V. Trofimov
FLNP	N.V. Rebrova

Abstract and scientific rationale:

Experimental study of the methods for registration and measurement of neutron resonances upon passage of radiation generated by a neutron source through various materials. Neutron resonance spectroscopy and radiography for investigation of the properties of materials in extreme states.

Development and study of the methods of nondestructive inspection of samples and materials using thermal and epithermal neutrons.

A neutron image detector with high spatial (20-50 mkm) and time (50-100 ns) resolution will be developed in the framework of development of methods of real-time neutron tomography with thermal and resonance neutrons. This study is aimed at a broad range of fast processes in the field of the physics of extreme states of matter and material research. This method will allow one to study the physical and chemical composition of machine-building materials, gaseous cavities inside structural materials with high atomic mass. Another important advantage of neutron radiography is the possibility of visualization of hydrogen-containing substances in a metal matrix.

Automation of the IREN facility using SCADA "HOROCYCLE" and specialized detectors and data acquisition systems for monitoring and analysis of neutron and gamma fields in the hot zone of the IREN facility.

Expected results at the end of the activity:

Practical implementation of the method of nondestructive measurement of parameters of materials in extreme states. Practical implementation of the method of nondestructive study of composite materials.

Study of the feasibility of development of low-current power supply elements based on decay of unstable isotopes produced using a neutron source.

Automation system of the IREN facility including monitoring and control of separate parts of the accelerator.

Expected major results in the current year:

Numerical and experimental determination of optimal characteristics of the neutron source.

Experimental determination of an optimal configuration of the experiment design to achieve the required measurement precision.

Improvement of methods for registration of parameters of neutron resonances.

Measurement of experimental spectra of neutrons from various materials irradiated by accelerated electron beams.

Testing of neutron and gamma detectors in the hot zone of the IREN facility.

Development of the system for data acquisition and transmission of information from detectors to the control panel using SCADA "HOROCYCLE".

4. Creation and commissioning of the station SHINE. Experimental studies at extracted beams of the NICA accelerator complex

**A.A. Baldin
V.A. Kukharev**

2025-2027

Preparation Data taking

VBLHEP V.A. Aleksandrov, E.V. Arkhipov, V.I. Astakhov, S.V. Afanas'ev, E.G. Baldina, A.V. Beloborodov, A.I. Berlev, Ver.V. Bleko, Vit.V. Bleko, E.A. Bushmina, S.A. Chetverikov, P.R. Kharyuzov, E.A. Klevtsova, D.S. Korovkin, A.V. Pavlyuk, M.Yu. Petrov, N. Sagimbayeva, A.B. Safonov, S.Yu. Starikova, G.G. Stiforov, A.Yu. Troyan, Yu.A. Troyan

Abstract and scientific rationale:

The station SHINE is designated for experimental research in the field of relativistic nuclear collisions. The specific feature of the station SHINE is the feasibility of experiments with maximum intensities of extracted beams and bulk targets (beam-dump experiments).

The research program includes the continuation of the studies in the field of relativistic nuclear technology. Experiments with light nuclei from protons to magnesium with energies from hundreds MeV/nucleon to 2.5 GeV/nucleon with the aim of optimization of beam and target types for prototyping accelerator driven power plants.

The fundamental component of the research program implies the preparation and performing beam-dump experiments aimed at measurement of deep subthreshold reactions with registration of strange and charmed particles with masses below 3 GeV, as well as the search of hypothetical Dark matter particles in interaction of relativistic nuclei with energies up to 4.5 GeV/nucleon with extended targets.

Expected results at the end of the activity:

Creation and commissioning of the station SHINE. Systematic study of the space-time pattern of neutron production under high intensity beams of protons and light ions bombarding extended targets in the same experimental conditions. Exploratory experiments on production of deep subthreshold particles and Dark matter particles.

Expected major results in the current year:

Assembly, laboratory and beam testing of detectors for beam monitoring at the target. Commissioning of the monitoring and control system of the station SHINE and the data acquisition system using SCADA "HOROCYCLE". First trial experiments

at extracted beams of the NICA accelerator complex, including with extended targets. Development and prototyping of specific detectors for the search of Dark matter signals. Monte Carlo simulation of experiments at the station SHINE.

Abstract and scientific rationale:

Measurement of the neutrino mass hierarchy in the long-f reactor experiment. Precise determination of the parameters of neutrino oscillations. Study of neutrino fluxes from various sources: the Sun, the Earth and others.

Expected results upon completion of the project:

Determination of the ordering of neutrino masses with an accuracy of $> \sim 3\sigma$, precision measurement of the spectrum of reactor antineutrinos, search for sterile neutrino states, measurement of solar and geoneutrino fluxes.

Expected results of the project this year:

Measurement of the observed spectrum of atmospheric neutrino in the JUNO detector. Measurement of reactor antineutrino spectrum in the TAO detector. Precision measurement of the neutrino oscillation parameters and determination of the neutrino mass ordering with significance of 3 standard deviations using external measurements made by other experiments.

MLIT N.A. Balashov

Abstract and scientific rationale:

Measurement of the neutrino mass hierarchy, CP violation and other parameters of neutrino oscillations in the NOvA and T2K long baseline accelerator experiments. Study of tau leptons production via D_S meson production and decay in proton-nucleus collisions at 400 GeV/c (the NA65/DsTau experiment). Study of high-energy neutrino properties in the range of ~ 100 GeV — 3 TeV at the LHC collider in CERN (the FASER experiment). Search for new particles and exotic reactions. Estimation of neutrino interaction cross-sections.

Expected results upon completion of the project:

Determination of the neutrino mass ordering and the lepton CP-parity violation parameter in long baseline accelerator experiments at a significance level of $\sim 3\sigma$, precise measurement of the Δm^2_{32} and $\sin^2\theta_{23}$ oscillation parameters. Joint analysis of neutrino experiment data. Search for new particles and exotic reactions. Measurement of neutrino interaction cross sections of all types for the energy range of 100–3000 GeV. Measurement of the D_S meson production cross-section in proton-nucleus collisions with subsequent decay to a tau lepton at 400 GeV/c. Refinement of the measurement of the tau neutrino flux from accelerators.

Expected results of the project this year:

Continuing data collection in the experiment detectors and data processing. Preparing publications on measuring neutrino oscillation parameters in the NOvA and T2K experiments, searching for magnetic monopoles and lightly ionizing particles, and registering atmospheric neutrinos in the NOvA experiment's far detector. Development of the new particle identification methods for the SFGD detector data analysis. Development of the software for tracking and vertexing analysis for very high track density in emulsion detectors.

VBLHEP N.V. Gorbunov

MLIT I. Satyshev

Abstract and scientific rationale:

Investigation of gamma radiation and charged cosmic rays (CRs) in the energy range of 10^{13} – 10^{18} eV by detecting Cherenkov radiation from extensive air showers: studying the high-energy edge of the spectrum of the brightest galactic and extragalactic sources of gamma radiation, searching for galactic PeVatrons, applying a new hybrid approach to study mass composition of CRs in the range of 10^{14} – 10^{17} eV, studying of CR anisotropy in the energy range of 100–3000 TeV.

Expected results upon completion of the project:

Investigation of the energy spectrum of gamma quanta from galactic sources and the search for new sources of gamma quanta. Monitoring of the flux of gamma rays from nearby extragalactic sources. Search for TeV gamma rays from gamma-ray bursts and gamma rays correlated with high-energy neutrinos. Search for cosmic accelerators in which protons are accelerated to energies of 100–3000 TeV. Investigation of the mass composition of cosmic rays in the region of transition from galactic to extragalactic rays.

Expected results of the project this year:

Further collection and analysis of data to reconstruct the spectrum of gamma rays from galactic sources. Upgrade of the 5th Cherenkov telescope, development of the 6th Cherenkov telescope with a diameter of 10 meters, development and preparation of new Cherenkov detectors. Methodological studies of the water attenuation length for water Cherenkov tanks.

Abstract and scientific rationale:

Study of neutrino properties. Search for new vector and scalar light particles-candidates for dark matter. Methodical studies on SHiP detectors.

Expected results upon completion of the activity:

Evaluation of the SHiP experiment sensitivity and its consideration while forming requirements for detectors. Preparation of a project for JINR participation in the SHiP experiment, taking into account the methodological studies carried out for detector systems based on scintillators and straw tubes.

Expected results of the activity this year:

Beam tests and other methodological measurements validating the design of a UBT detector with the required time resolution. Methodological studies with straw tubes and various electronics options for use in the SHiP experiment.

2.	Experiment Borexino/DarkSide	O.Yu. Smirnov	2026-2028
			Data analysis

DLNP M.V. Gromov, D.V. Korablev, O.E. Lychagina, O.B. Samoylov, A.S. Sheshukov, A.P. Sotnikov, A.V. Vishneva

Abstract and scientific rationale:

Completion of analysis of unique data from the Borexino detector. Search for dark matter particles and rare processes in the DarkSide-50 and DarkSide-20k experiments.

Expected results upon completion of the activity:

Refinement of solar neutrino flux measurements based on the largest and best-quality Borexino dataset. Obtaining new constraints on rare processes and non-standard neutrino interactions from Borexino data. Searching for light dark matter particles with sensitivity two orders of magnitude greater than current limits. Searching for rare processes in the DarkSide-50 and DarkSide-20k experiments and obtaining corresponding constraints on reaction parameters.

Expected results of the activity this year:

Preparation of publication of the results of the analysis of the full Borexino dataset, including a new data processing method. Expected physics results include refinement of solar neutrino fluxes, particularly the solar pp-neutrino flux, and the search for rare processes (neutrino magnetic moment, etc.). Preparation of publication of the results of the search for the contribution of

intrinsic resolution to the full width of the liquid argon scintillation line in the DarkSide experiment; study of the cosmogenic production of isotopes potentially hazardous to the experiment.

MLIT D. Goderidze, A. Khvedelidze

VBLHEP D. Baigarashev, T.L. Enik

Abstract and scientific rationale:

Charged-lepton flavour-violating (CLFV) processes offer deep probes for new physics with discovery sensitivity to a wide range of new physics models — SUSY, Higgs Doublets, Extra Dimensions, and, particularly, models explaining the neutrino mass hierarchy. The most sensitive exploration of CLFV processes is ensured by experiments that utilize high intensity muon beams to search for CLFV $\mu \rightarrow e$ transitions, such as: $\mu^+ \rightarrow e^+ \gamma$ (MEG at PSI, Switzerland); $\mu^+ \rightarrow e^+ e^- e^+$ (Mu3e at PSI, Switzerland) and the coherent neutrinoless conversion of a muon into an electron in the field of a nucleus $\mu^- N \rightarrow e^- N$ (COMET at J-PARC, Japan; Mu2e at Fermilab, USA).

The COMET experiment seeks to measure the neutrinoless coherent transition of a muon to an electron in the field of an aluminium nucleus. The event signature of coherent neutrinoless $\mu^- \rightarrow e^-$ conversion in a muonic atom is the emission of a monoenergetic single electron in a certain time interval. The energy of the signal electron for aluminium is 104.97 MeV, and the lifetime of the muonic atom is 864 ns.

This makes neutrinoless $\mu^- \rightarrow e^-$ conversion very attractive experimentally. Firstly, the e^- energy of about 105 MeV is well above the end-point energy of the muon decay spectrum (~ 52.8 MeV). Secondly, since the event signature is a monoenergetic electron, no coincidence measurement is required. Thirdly, the long lifetime means that backgrounds associated with the beam flash can be eliminated. Thus, the search for this process has the potential to improve sensitivity by using a high muon rate without suffering from accidental background events.

There exist various theoretical models which predict sizable charged lepton mixing branching ratios. Among them, the best motivated models are the supersymmetric (SUSY) extensions of the SM, such as SUSY-GUT or SUSY-Seesaw models. Modern theoretical motivations for lepton flavor violation, data on current experimental bounds and expected improvements are reviewed by Marciano, Mori and Roney.

The COMET experiment will be carried out in two stages: Phase-I and Phase-II. The experimental sensitivity goal for this process in Phase-I is 3.1×10^{-15} , or the 90% upper limit of the branching ratio of 7×10^{-15} , which is a factor of 100 improvement of the existing limit $B(\mu^- + \text{Au} \rightarrow e^- + \text{Au}) \leq 7 \times 10^{-13}$ from SINDRUM II at PSI. The goal of Phase-II is a SES of 2.6×10^{-17} , which is a factor of about 10 000 better than the current experimental limit. The expected number of background events is 0.032, with a proton beam inter-bunch extinction factor of 3×10^{-11} . To achieve the target sensitivity and background

level, the 3.2 kW 8 GeV proton beam from J-PARC (Japan) will be used. Two types of detectors - CyDet (cylindrical detector system) and StrECAL (straw tracker and electron calorimeter) - will be used for detecting the $\mu^- \rightarrow e^-$ conversion events and for measuring beam-related background events.

Scientists from DLNP JINR successfully participate in the preparation stage of the COMET experiment. For Phase-I, JINR specialists manufactured and tested the entire set of straw tubes with a diameter of 9.8 mm and a length of 1.6 m (more than 2700 pieces), and for Phase-II, they will produce a full set of straw tubes with a diameter of 5 mm. The JINR specialists actively participate in the creation of the straw tracker, the electromagnetic calorimeter and the cosmic ray veto system (CRV) at the stages of modelling and scientific and technical activities. They will also continue to be actively involved in the assembly and maintenance of these detectors. The JINR specialists participate in the analysis of the test measurement data and will participate in the analysis of the COMET experiment data.

Expected results upon completion of the project:

Completion of assembly, testing, calibration, installation, cosmic test and maintenance of the straw detector for Phase-I.

Development and optimization of the crystal calibration method for the calorimeter with allowance for the features of the experiment: the presence of the magnetic field and the high-resolution calorimeter.

Simulation of a complex detector system (tracker, calorimeter, etc.).

Participation in the preparation, engineering and physics run, acquisition and analysis of data of Phase-I.

Research and development for production of straw tubes with a wall thickness of 12 μm and a diameter of 5 mm. Measurement of all mechanical properties and development of quality control standards for manufactured new straw tubes 5 mm in diameter.

Production of straw tubes (about 1000 pcs) for a full-scale prototype.

Production of a full-scale straw station with new tubes (5 mm, 12 μm) at JINR, and measurements on the beam.

Preparation, mass-production and testing of straw tubes for Phase-II.

Full participation in the design, assembly, installation, cosmic test and maintenance of the calorimeter.

Participation in the assembly and maintenance of the CRV for Phase-I and Phase-II.

Participation in the beam tests of the detector components for Phase-II.

Participation in the assembly, testing, installation and maintenance of the entire detector system for Phase-II.

Expected results of the project this year:

Assembly of the 5th straw tracker station for Phase-I followed by wire tension verification and high-voltage testing.

Development of methods for optimal light collection in the electromagnetic calorimeter and solution of the calorimeter calibration problems using Geant4 simulation.

Simulation of the complex detector system (tracker, calorimeter, etc.).

Participation in the preparation of the engineering and physics run of Phase-I.

Research and development for production of straw tubes with a diameter of 5 mm and a wall thickness of 12 μm . Measurement of all mechanical properties and development of quality control standards for manufactured new straw tubes 5 mm in diameter.

Production of straw tubes (5 mm, 12 μm) and long-term testing of their mechanical properties and pressure tightness.

Development and construction of new test stands for the long-term testing of straw tubes (5 mm, 12 μm) under various parameters.

Production of a full-scale straw station with new tubes (5 mm, 12 μm) at JINR, in particular: development and construction of a gas system, development of technology for the production of aluminum housings and plastic insulators for straw end-plugs, development and construction of a stand for tube assembly and tests with a radioactive source.

Creation of radiation shielding for the muon beam.

Participation in the assembly and testing of the electromagnetic calorimeter.

Participation in the assembly, testing and installation of the CRV for Phase-I.

Nuclear Physics (03)

Neutron Nuclear Physics

Theme leaders:

Yu.N. Kopatch
P.V. Sedyshev
V.N. Shvetsov

Participating countries and international organizations:

Albania, Armenia, Azerbaijan, Bangladesh, Belarus, Brazil, Bulgaria, CERN, China, Croatia, Cuba, Czech Republic, Egypt, Finland, France, Georgia, Germany, Hungary, IAEA, India, Italy, Japan, Kazakhstan, Mexico, Moldova, Mongolia, North Macedonia, Poland, Republic of Korea, Romania, Russia, Serbia, Slovakia, Slovenia, South Africa, Switzerland, Thailand, Turkey, USA, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:

Nuclear physics research with neutrons is traditionally one of the priority areas developed at JINR. These studies are carried out within the framework of the scientific theme "Neutron Nuclear Physics" (03-4-1146-2024). The integrated use of the FLNP basic facilities (IREN pulsed source of resonance neutrons, IBR-2 pulsed reactor, EG-5 electrostatic generator, as well as TANGRA facility) makes it possible to conduct nuclear physics research in a wide range of neutron energies from cold neutrons to ~20 MeV, and the use of external neutron sources, such as the n_TOF neutron time-of-flight facility at CERN, allows expanding the energy range to several hundreds of MeV.

The research and development activities within the framework of the theme are aimed at implementing the tasks formulated in the Seven-Year Plan for the Development of JINR for 2024–2030 in the field of "Nuclear Physics".

The physics investigations can be grouped into three research areas:

- study of violations of fundamental symmetries in the interactions of neutrons with nuclei, obtaining nuclear data;
- study of fundamental properties of the neutron, physics of ultracold and very cold neutrons;
- applied and methodological research.

The scientific program of the theme "Neutron Nuclear Physics" will be implemented within the framework of four projects: two scientific ("Investigations of neutron nuclear interactions and properties of the neutron" and "TANGRA") and two scientific and technical projects ("Modernization of the EG-5 accelerator and its experimental infrastructure" and "Development of the concept of an ultracold neutron source at the IBR-2 pulsed reactor").

Projects in the theme:

Name of the project	Project leaders	Project code
1. Development and elaboration of the tagged neutron method for determining the elemental structure of matter and studying nuclear reactions (TANGRA - Tagged Neutrons and Gamma Rays)	Yu.N. Kopatch	03-4-1146-1-2014/2028
2. Modernization of the EG-5 accelerator and its experimental infrastructure	A.S. Doroshkevich	03-4-1146-2-2022/2027
3. Investigations of neutron nuclear interactions and properties of the neutron	V.N. Shvetsov P.V. Sedyshev	03-4-1146-3-2024/2028
4. Development of the concept of an ultracold neutron source at the IBR-2 pulsed reactor	V.N. Shvetsov G.V. Kulin <i>Deputy:</i> A.I. Frank	03-4-1146-4-2026/2027

			Upgrade Data acquisition Data analysis
FLNP	N.A. Fedorov, D. Grozdanov, C. Hramco, P.I. Kharlamov, P.S. Prusachenko, V.R. Skoy, V.N. Shvetsov, T.Yu. Tretyakova		
VBLHEP	V.Yu. Aleksakhin, S.V. Khabarov, Yu.N. Rogov, M.G. Sapozhnikov, V.M. Slepnev, N.I. Zamiatin, E.V. Zubarev		
DLNP	A.V. Krasnoperov, A.V. Salamatin		

Abstract and scientific rationale:

Information about neutron-nuclear interactions is extremely important for both fundamental and applied physics. The fact that the neutron has no electric charge makes it a unique probe for studying nuclear forces. Due to electrical neutrality, the high penetrating power of neutron radiation makes it promising for studying the structure of matter at both the nuclear and molecular levels. Neutrons are also widely used for applied purposes: in inspection systems, non-destructive elemental analysis facilities, in instruments for studying the immediate environment of boreholes (logging), as well as in the creation of neutron and gamma radiation detectors used on board orbital and descent spacecraft for analysis of soil and atmosphere of celestial bodies. Information about neutron-nuclear reactions is also necessary for the design of promising nuclear power facilities, as well as for modeling various devices and objects that interact with neutron radiation in one way or another. An indicator of the relevance of studying the characteristics of neutron-nuclear interactions can be the fact that the list of the most requested nuclear data for the most part consists of queries directly related to neutron-nuclear reactions.

The TANGRA (TAGged Neutrons and Gamma Rays) project is aimed at studying neutron-nuclear reactions using the tagged neutron method, finding new ways to use neutron methods in fundamental and applied research, improving existing and creating new approaches to processing the results of nuclear physics experiments. One of the tasks to be solved within the framework of the project is the interpretation of existing experimental data on the reactions of interaction of fast neutrons with atomic nuclei, their systematization and validation. The priority area of work is the acquisition of nuclear data.

Expected results upon completion of the project:

Performing experiments to study the angular distributions of scattered neutrons.

Experimental study of (n,γ) and (n',γ) -correlations.

Theoretical description of the studied reactions.

Conducting experiments to study the reaction $(n,2n)$.

Conclusion on the applicability of the tagged neutron method for elemental analysis of soils. In case of a positive result, the creation of prototypes of stationary and mobile facilities, as well as methodological recommendations for their use for agricultural and environmental monitoring.

The results obtained during the implementation of this project will be valuable for both fundamental and applied science. The obtained experimental data on the yields and angular distributions of γ -rays can be used to increase the accuracy of Monte Carlo simulations of various physics facilities. Another planned application of the obtained experimental results is fast elemental analysis. Optimized model parameters can be used to theoretically describe previously unstudied reactions. The developed prototypes of facilities for elemental analysis of soils can become the basis for creating devices useful for intensifying agriculture and monitoring the state of the environment.

Expected results of the project in the current year:

Measurement of cross sections and angular correlations for the $(n,2n)$ reaction for various nuclei induced by 14.1-MeV neutrons.

Measurement of the energy dependence of differential cross sections for neutron and γ -ray emission in reactions of high-energy neutrons with nuclei.

Measurement of angular correlations between neutrons and γ -rays emitted in the $(n,n'\gamma)$ and $(\alpha,n\gamma)$ reactions, as well as in the fission reaction.

**2. Modernization of the EG-5
accelerator and its experimental
infrastructure**

A.S. Doroshkevich

2022-2027

Upgrade Data acquisition Data analysis
--

FLNP Aradeib Ayman Omer Ali, I.A. Chepurchenko, Ibrahim Mahmud Ahmed-Mustafa-Ahmed, A.N. Likhachev,
V.N. Semenov, K.E. Studnev, S.N. Tkachenko, K.N. Udovichenko, I.A. Zaitsev

Abstract and scientific rationale:

The project is aimed at modernizing the main systems of the EG-5 electrostatic charged-particle accelerator and developing ion-beam methods, as well as complementary techniques, for studying the elemental composition and physical properties of the near-surface layers of solids.

Goals of the project: To ensure the technical capability to implement the scientific program of the JINR Topical Plan for studies of reactions induced by fast quasi-monoenergetic neutrons; to develop nuclear-physics methods for analyzing elemental composition; to address problems in neutron-radiation materials science; and to implement practical applications of neutron physics.

Objectives of the project. The main technical objective of the project is to restore the accelerated-particle energy range of 900 keV to 4.1 MeV and increase the ion-beam current to more than 100 μA , while maintaining the ion-beam energy stability at a level of no more than 500 eV and ensuring the spatial stability of the ion beam.

The main organizational objective is to establish and develop the human-resources potential required to ensure the full implementation of the project and its scientific program over a horizon of at least three seven-year planning periods.

The project objectives also include upgrading the experimental infrastructure of the accelerator complex and supplementing it with new techniques. In particular, this involves developing new methods for studying the physical properties of material surfaces that can complement existing methods and improve the quality of the scientific results obtained; intensifying international scientific and technical cooperation; organizing a user policy; and establishing an interlaboratory accelerator center on the basis of FLNP JINR to address a broad range of unique scientific and technological challenges.

The main criterion for the successful implementation of the project is to ensure a neutron flux sufficient for conducting nuclear-physics experiments with fast neutrons.

Expected results upon completion of the project:

Upon completion of the project, the technical parameters of the accelerator (an accelerated particle energy of 4.1 MeV at a maximum current of at least 100 μA) will be restored, enabling research on fast neutron reactions at JINR. The ion beam irradiation chamber will also be modified.

A new specialized laboratory will also be established for the preparation and study of the structure, microstructure, and optical and electronic properties of the surfaces of studied objects using ellipsometry, optical and electron microscopy, and DC/AC electrical characterization methods (voltammetry and impedance spectroscopy).

In addition to upgrading and expanding the instrument base of the accelerator complex, steps will be taken to build human-resources potential for the next 20-30 years.

The modernization of the EG-5 accelerator at JINR will enable, in the short term, a number of new and unique experiments, including measurements of the energy spectra and angular distributions of charged particles produced in (n, α), (n, p), (α , n), and (p, n) reactions, as well as measurements of the integral and differential cross sections of these reactions over a neutron-energy range of up to ~ 6 MeV. It will also enable studies of the fission of atomic nuclei induced by fast neutrons, experiments in neutron materials science, and other investigations.

Expected results of the project in the current year:

The EG-5 electrostatic accelerator will be restored to operation in its basic configuration, and work on physics experiments will begin.

The specified ion-beam parameters will be achieved, enabling implementation of the scientific program of the JINR Topical Plan for studying reactions induced by fast quasi-monoenergetic neutrons.

The technical group of the Sector of Nuclear Physics and Ion-Beam Analysis will be brought up to full staffing, and technical personnel will be trained to support the implementation of the User Program on the EG-5 accelerator.

A new microwave ion source will be installed on the existing accelerator tube.

A control system for the new ion source will be developed and installed.

The vacuum system and the ion-beam transport system will be automated.

The vacuum pumps of the accelerator tank will be replaced.

An electron microscope will be installed in Building 120 at the DLNP site.

The specialized laboratory in Building 120 at the DLNP site will be further equipped.

3.	Investigations of neutron nuclear interactions and properties of the neutron	V.N. Shvetsov P.V. Sedyshev	2024-2028

Abstract and scientific rationale:

Nuclear processes and structural changes in materials induced by slow, resonance and fast neutrons and accelerated charged particles are traditionally in the focus of research attention at FLNP JINR. The interaction of neutrons with atomic nuclei is of interest for both fundamental and applied research. The integrated use of the FLNP basic facilities (IREN pulsed source of resonance neutrons, IBR-2 pulsed reactor, EG-5 electrostatic generator) makes it possible to conduct nuclear physics research in a wide range of neutron energies from cold neutrons to ~20 MeV, and the use of external neutron sources, such as the n_TOF neutron time-of-flight facility at CERN, allows expanding the energy range to several hundreds of MeV. Fundamental research carried out at the FLNP Department of Nuclear Physics includes studies on the violation of space and time symmetry, the mechanism of nuclear reactions, the structure of atomic nuclei, fission processes induced by neutrons, neutron-induced reactions with the emission of light particles, the properties of the neutron as an elementary particle, the properties of ultracold and very cold neutrons, quantum mechanical effects involving neutrons.

Also, in FLNP, a variety of research programs has been developed for applied investigations, such as obtaining nuclear data and information on the radiation resistance of materials for nuclear technologies, power engineering and transmutation, radiation mutagenesis on fast neutrons, neutron activation analysis using thermal and epithermal neutrons, neutron activation analysis using prompt gamma-rays, elemental analysis using neutron resonances, elemental analysis using fast neutrons, analysis of the elemental composition of thin films, investigation of the radiation resistance of materials to the effects of accelerated charged particles on electrostatic accelerator beams, development of radiation-resistant nanostructured materials using accelerated ion beams.

Expected results upon completion of the project:

Refinement of characteristics of the known resonances and detection of previously unknown ones.

Measurement of reaction cross sections and product correlations in the resonance region with an accuracy sufficient to study P- and T-odd effects. Performing experiments to study TRI and ROT effects in fission, measuring the mass-energy and angular distributions of fragments, prompt neutrons and gamma-rays; searching for rare and exotic fission modes, using both IBR-2 and third-party sources.

Conducting experimental and theoretical studies of neutron-nuclear reactions in a wide range of energies of incident particles.

Study of the neutron dispersion law in a refractive medium, including in the case of high accelerations.

Development of models for calculating the transport of UCN and CN in the material of nanodiamond reflectors and the extension of their applicability to the range of thermal neutrons.

Study of the structure of graphites after their intercalation and measurement of cross sections for cold neutron scattering by intercalated graphites.

Obtaining data for nuclear power engineering and astrophysics: measurement of integral and differential neutron cross sections, angular correlations in the energy range from cold neutrons to hundreds of MeV.

Study of radiation resistance of various materials, including those promising for use as neutron reflectors and moderators. Development and study of radiation resistance of electronic components, including those operating on new physical principles.

Development of energy and electronics devices using powder nanotechnology and ion beams.

Obtaining new data and monitoring the environmental situation in certain regions of the JINR Member States with the help of NAA.

Study of the influence of neutron irradiation on the properties of biological objects and tissues.

Investigation of layered structures, including high-temperature superconductors using RBS, ERD and PIXE techniques.

Performing elemental analysis of various objects of cultural heritage.

Expected methodological results:

Determination of optimal technologies for the synthesis and modification of substances for use as UCN and CN reflectors.

Development of methods for cleaning water and soil, and assessing the quality of food products.

Study of the processes of accumulation of nanoparticles in the organs of animals and plants, assessment of their impact on the health of living objects under study.

Development of a technique for non-destructive elemental analysis using prompt gamma-rays. Improvement of existing methods of activation analysis using thermal and resonance neutrons.

Development of methods for analyzing the electrical properties of developed electronic devices, power engineering devices, and ionizing radiation sensors based on new physical principles.

The fundamental results obtained during the implementation of the project will be of great importance for understanding the mechanisms of neutron-nuclear reactions and the development of theoretical ideas about these processes. The study of P- and T-odd effects will provide information on the contribution of the weak interaction to nuclear forces and can serve as an alternative method for determining the mixing coefficient V_{ud} of a CKM matrix. Obtaining new information about ROT and TRI effects, as well as exotic fission modes, will make it possible to clarify the features of one of the stages of this process – the scission of a fissile nucleus into fragments. The data obtained during the implementation of the neutron-optical part of the project will be needed to create new neutron moderators and reflectors. In addition, they will allow significant progress in the development of neutron microscopy methods and studies of the magnetic structure of various objects.

The implementation of the applied research program of the project will be of great social importance and contribute to the progress of environmental, materials science, archaeological, and nanotechnological investigations, as well as promising developments in the field of modern electronics and energy. The techniques of elemental and structural analysis being created and modernized will be in demand in many branches of human activity.

Solution of the problem of quantitative separation of contributions of painting components in elemental analysis of microsamples.

Newly developed and upgraded methods of elemental analysis, combined with statistical data processing, can help address important issues such as the attribution and indirect dating of cultural heritage objects.

Expected results of the project in the current year:

To extract the partial neutron widths of the p-wave resonance of ^{35}Cl at 398 eV from experimental data, it is planned to derive an analytical description of the anisotropy coefficient for γ -ray emission in the $^{35}\text{Cl}(n,\gamma)$ reaction using the Sushkov-Flambaum formalism. It is also intended to master a method for determining the sign of the γ -ray emission amplitude for a specific transition using experimental data.

Further development of the instrument on the 16-m flight path of beamline 4 of the IREN facility, and of the measurement methodology, with the aim of determining the parameters of p-wave neutron resonances in the elastic scattering channel.

Development of methods for detecting and reconstructing rare fission events using position-sensitive ΔE -E telescopes.

Study of the mechanisms of ternary and quaternary fission of heavy nuclei based on the analysis of energy and angular correlations of fission products.

Acquisition of new experimental data on the neutron resonance capture reactions $^{175}\text{Lu}(n_{\text{res}},\gamma)^{176}\text{Lu}$ and $^{176}\text{Lu}(n_{\text{res}},\gamma)^{177}\text{Lu}$ at neutron energies up to 105 eV. On the basis of measurements performed at the Back-n facility (CSNS) using an HPGe detector, studies of ^{175}Lu resonances in the range of 2-105 eV are planned.

Acquisition of data on possible *K*-mixing effects in the wave functions of highly excited states of the ^{176}Lu compound nucleus.

Preparation of the experimental setup and conduction of methodological work to study TRI and ROT effects in neutron-induced fission of ^{235}U .

Measurements of the cross sections of (n,α) reactions on $^{50,52,53}\text{Cr}$ and ^{171}Yb nuclei, and of the angular distributions of α -particles from the $^{35}\text{Cl}(n,\alpha)$ reaction induced by fast neutrons using solid samples.

Continuation of work on determining the elemental composition of archaeological finds, as well as of a series of industrial samples using neutron resonance analysis methods (radiative capture, transmission) on beamline 3 of the IREN facility.

Study of the elemental characteristics of cultural heritage materials in the context of current issues in attribution, dating, and archaeological interpretation.

Assessment of environmental conditions (air, soil, water) and development of methods to reduce environmental impact and risks to human health.

Study of the effects of nanoparticles on plants and animals for application in agriculture and medicine.

Preparation of an experiment to measure neutron velocity in matter.

Investigation of the feasibility of a Fizeau-type experiment with neutrons.

Measurement of neutron scattering cross sections for DND powder as a function of its density.

Induction of mutants to breed crop varieties resistant to drought and soil salinity.

4. Development of the concept of an ultracold neutron source at the IBR-2 pulsed reactor	V.N. Shvetsov	2026-2027
	G.V. Kulin	Realization
	Deputy: A.I. Frank	

FLNP V.I. Bodnarchuk, M.V. Bulavin, A.N. Chernikov, V.M. Milkov, A.Yu. Muzychka, A.Yu. Nezvanov, A.A. Popov, Pham Khac Tuyen, A.D. Rogov, M.A. Zakharov, 6 engineers, 3 workers

Abstract and scientific rationale:

The aim of the project is to develop a concept for a world-class ultracold neutron (UCN) source at the IBR-2 pulsed reactor. The development and construction of a UCN source at JINR is a highly relevant task. The research program at the future source will be based on the development of results obtained in previous years by JINR physicists in collaboration with other research centers. It is assumed that the priority areas will be a precision test of the weak equivalence principle using gravitational quantum spectrometry and the study of the universal acceleration law in the quantum sector.

The creation of an intensive UCN source at the IBR-2 pulse reactor is a rather complex task, since, despite the record high value of the neutron flux density in a pulse, this reactor is characterized by a relatively low value of the average neutron flux density. Due to the uniqueness of the IBR-2 reactor, the solution to this problem is associated with the search for fundamentally new technical solutions. At present, the design scheme of the source has been developed. It is proposed to use a thin chamber with liquid hydrogen as a converter. It is planned to implement the principle of pulsed neutron accumulation (PNA), which will allow for a significant gain in the density of neutron gas in a material trap. In order to preserve the pulsed structure of the neutron flux during transportation, which is absolutely necessary for the implementation of the PNA principle, it is proposed to obtain UCN by slowing down faster very cold neutrons (VCN) directly before the trap in a superconducting magnetic resonance system.

During the implementation of the project, a prototype source (PS) will be built at the site of the future source on beamline 3 of the IBR-2 reactor. It will differ from the designed source by the absence of a slowing-down superconducting magnetic resonance system and a cryogenic converter based on mesitylene, which does not require complex safety measures. The internal surface of the PS neutron guide will not be subject to the same strict requirements as the neutron guide of the designed source. At the same time, the design of PS will have much in common in its main features with the design of the future source. The construction of PS will allow us to verify the correctness of the technical solutions adopted for the creation of the projected source, as well as to conduct experimental studies necessary for developing a full-fledged concept of the projected source. In addition, the creation of such a source will allow the young researchers of the group, which will build the UCN source and begin physical research on it, to gain their first practical experience of working with neutrons.

Expected results upon completion of the project:

Development of a concept for a world-class ultracold neutron source at the IBR-2 pulsed reactor.

Development and construction of a prototype source to test the correctness of the proposed technical solutions and conduct experimental studies necessary for developing a full-fledged concept of the projected source.

Expected results of the project in the current year:

Analysis of the potential for additional compression of neutron bunches at the entrance to the UCN trap.

Analysis of safety issues associated with the use of a small-volume cryogenic liquid-hydrogen converter.

Development of a concept for a UCN source at the IBR-2 reactor.

Completion of the design of the prototype source at beamline 3 and preparation of the design documentation.

Fabrication of engineering infrastructure components for the prototype source at beamline 3, enabling the source to be moved from the operating position to the standby position with a closed shutter.

Fabrication of equipment for experiments with very cold neutrons at the VCN source.

Development of the physical design of a spin-echo instrument for very cold neutrons.

Activity of the theme:

Name of activity		Leaders	Implementation period
Laboratory	Responsible from laboratories		Status
1. Neutron resonance spectroscopy		A.A. Baldin V.N. Shvetsov	2025-2027
			Realization Data acquisition
VBLHEP	V.I. Astakhov, E.G. Baldina, A.V. Beloborodov, Ver.V. Bleko, Vit.V. Bleko, D.N. Bogoslavsky, E.A. Bushmina, S.A. Chetverikov, P.R. Kharyuzov, E.A. Klevtsova, D.S. Korovkin, V.A. Kukharev, A.B. Safonov, S.V. Semashko, S.Yu. Starikova, Yu.A. Troyan, A.Yu. Troyan		
FLNP	N.V. Rebrova, P.V. Sedyshev		

Abstract and scientific rationale:

Experimental study of methods for detecting and measuring neutron resonances upon passage of radiation generated by a neutron source through various materials. Neutron resonance spectroscopy and radiography for studying the properties of materials in extreme states.

Development and study of methods of nondestructive testing of samples and materials using thermal and epithermal neutrons.

Within the framework of development of methods of real-time neutron tomography with thermal and resonance neutrons, a neutron image detector with high spatial (20–50 μm) and time (50–100 ns) resolution will be developed. This study is aimed at a broad range of fast processes in the field of the physics of extreme states of matter and materials research. The method will make it possible to study the physical and chemical composition of machine-building materials, gas cavities inside structural materials with high atomic mass. Another important advantage of neutron radiography is the possibility of visualization of hydrogen-containing substances in a metal matrix.

Expected results at the end of the activity:

Practical implementation of the method of nondestructive measurement of parameters of materials in extreme states. Practical implementation of the method of nondestructive study of composite materials.

Study of the feasibility of development of low-current batteries based on the decay of unstable isotopes produced using a neutron source.

Expected major results in the current year:

Continuation of test experiments with gas-filled, scintillation, and microchannel neutron detectors.

Development of a system for monitoring and recording the parameters of the IREN facility.

Synthesis and Properties of Superheavy Elements, Structure of Nuclei at the Limits of Nucleon Stability

Theme leader: S.I. Sidorchuk
Deputy: A.V. Karpov
Scientific leader: Yu. Ts. Oganessian

Participating countries and international organizations:

Belarus, Brazil, China, France, Germany, India, Italy, Kazakhstan, Republic of Korea, Russia, South Africa, Vietnam.

The problem under study and the main purpose of the research:

Synthesis of nuclei at stability limits and the investigation of their properties. Investigation of the mechanisms of heavy-ion-induced reactions. Study of the physical and chemical properties of heavy and superheavy elements.

Projects in the theme:

Name of the project	Project leaders	Project code
1. Investigation of heavy and superheavy elements	M.G. Itkis A.V. Karpov	03-5-1130-1-2024/2028

Abstract and scientific rationale:

The Project aims to study the heaviest nuclei and atoms in a comprehensive way: conducting experiments on the synthesis of elements with $Z=119$ and 120 ; synthesizing new isotopes of superheavy elements; studying nuclear (spectroscopy) and chemical properties of superheavy elements; and investigating nuclear reaction dynamics, including multi-nucleon transfer, leading to the formation of neutron-rich heavy nuclei.

The project will be implemented mainly at the Superheavy Element Factory of JINR commissioned in 2020. The studies on nuclear reaction dynamics will be carried out at the U-400 accelerator complex before it is shut off for upgrade and will be pursued at U-400R after the facility is back in business. During the upgrade, studies on reaction dynamics and mechanisms will be carried out at the U-400M accelerator.

Expected results upon project completion:

- Synthesis of new superheavy elements 119 and 120.
- Synthesis of superheavy nuclei and study of their decay properties.
- Study of the chemical properties of superheavy elements.
- Spectroscopy of the radioactive decay of heavy and superheavy nuclei.
- First experiments aimed to measure the masses of superheavy nuclei.
- Study of the dynamics of heavy-ion nuclear reactions.

Expected results of the project in the current year:

- Experiments using the DGFRS-2 of the SHE Factory for synthesizing element 119.
- Experiments aimed at studying the properties of the radioactive decay (α -, β -decay, spontaneous fission) of short-lived isotopes with $Z=92-106$ at the SHELS separator using the GABRIELA and SFiNX detection systems and superheavy nuclei ($Z>106$) and their properties at the GRAND separator (DGFRS-3).
- Experimental and theoretical studies of the chemical properties of the homologs of Cn and Fl at the GRAND separator of the SHE Factory.
- Development of target and beam material production techniques for experiments on the synthesis of superheavy elements and study of their properties at the SHE Factory.
- Production of intense ^{50}Ti beams from the ECR ion source of the DC-280 cyclotron using the MIVOC method. Fabrication of a target of ^{249}Bk produced at the high-flux SM-3 reactor in RIAR
- Investigation of mass–energy and angular distributions of fragments formed in multinucleon transfer reactions and in fusion–fission and quasi-fission reactions.

Abstract and scientific rationale:

The investigations aim to study the structure of light nuclei and nuclear systems near and beyond the borders of nuclear stability using direct nuclear reactions (charge–exchange, one- or two-nucleon transfer), to investigate rare decay channels and the influence of reaction mechanisms on the observed properties of the studied nuclei. Direct reactions employed for studying the structure of isotopes near the borders of nuclear stability allow for more reliable data acquisition and the revision of existing knowledge. The experimental programme will be mainly implemented at the ACCULINNA-1,2 and MAVR setups using the upgraded U-400M accelerator complex of FLNR JINR that allow a wide range of experimental studies of light exotic nuclei using secondary beams in the energy range of 5–50 MeV/nucleon.

The ACCULINNA-2 separator will be equipped with a radio frequency filter for additional purification of secondary beams, a magnetic spectrometer for reaction product separation, a cryogenic target complex of hydrogen (including tritium) and helium isotopes, an array of neutron detectors based on stilbene crystals and BC-404 plastic, and systems for the registration of charged particles.

Expected results upon project completion:

Study of the properties of the drip-line isotopes of light nuclei.

First experiments using the tritium target.

Study of the structure of the drip-line isotopes of light nuclei in (d,p) and (d,n), (t,p), (t,a), (p,d), etc. reactions.

Studies of exotic decays, including $2n$ and $4n$ emission.

Investigation of nucleon and cluster transfer ($2n$, d , t , ^3He , etc.) in reactions involving light nuclei.

Expected results of the project in the current year:

Study of nuclei near the boundaries of nucleon stability.

Conduct of the $^6\text{He}+^4\text{He}$ experiments at the ACCULINNA-1,2 setups.

Preparation for and conduct of experiments at the ACCULINNA-1,2 fragment separators using radioactive beams and the cryogenic targets D_2 , ^4He .

Running of experiments on measuring the cross sections of individual reaction channels at ACCULINNA-1 employing the MULTI spectrometer.

Experiments with light exotic nuclei at ACCULINNA-1.

Development of the infrastructure of the ACCULINNA-2 fragment separator, including the RF kicker and the tritium target complex.

Non-Accelerator Neutrino Physics and Astrophysics

Theme leaders: E.A. Yakushev
S.V. Rozov

Participating countries and international organizations:

Azerbaijan, Belgium, Bulgaria, Czech Republic, France, Germany, Italy, Japan, Kazakhstan, Russia, Slovakia, Switzerland, United Kingdom, USA, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:

Search for neutrinoless and two-neutrino double beta decay and their investigation, identification of the nature of neutrinos, Majorana or Dirac, determination of absolute values of neutrino masses and their hierarchy, search for magnetic moment of electron neutrinos, and search for possible manifestations of dark matter. Investigations of in-core processes of the nuclear reactor at the Kalinin NPP. Search for signals from coherent reactor antineutrino scattering and their investigation. Precision study of the spectrum of coherent scattering to search for manifestations of New Physics. Search for sterile neutrinos. Spectroscopy of nuclei far from the line of beta stability. Study of interactions between intermediate-energy pions and helium nuclei. Development of new methods for detection of charged and neutral particles. Elaboration of methods for producing and purifying radionuclide preparations for synthesis of radiopharmaceuticals. Application of methods of hyperfine interaction to studies of radiopharmaceuticals and their precursors. Development and application of methods and techniques for manufacturing and analysing low-background materials with the exceptional ultra-low content of radioactive impurities.

Abstract and scientific rationale:

The project is aimed at developing methods for nuclear spectroscopy and radiochemistry for the use in nuclear medicine, astrophysics, and neutrino physics. The project involves novel techniques for particle detection, calibration of experimental facilities, evaluation of the background, and also design of exceptionally pure materials, etc., as well as development of methods of nuclear medicine, such as production and purification of radioisotopes, design and synthesis of radiopharmaceuticals, study of impact mechanisms at radionuclide decay locations, etc.

Specific area:

- new detectors (semiconductor detectors, liquid and plastic organic scintillators, composite scintillation detection systems, neutron and radon detectors, etc.);
- post-decay spectroscopy of electrons and other emissions with the focus on extremely low energies;
- standard gamma-spectroscopy based on semiconductor detectors (SCDs) with the focus on precision measurements of emission energy and source activity (of both point-like and volume sources) in order to study decay modes and to determine cross-sections of nuclear reactions;
- methods of hyperfine interactions using radioactive tracers, namely the Method of Perturbed Angular Correlations (PAC) and Emission Mössbauer Spectroscopy to study radiopharmaceuticals and their precursors in aqueous systems and other matrices;
- methods for production and purification of radionuclide preparations to synthesize radiopharmaceuticals, including their production using generators, physicochemical methods for evaluating properties of radionuclides and radiopharmaceuticals (their precursors) in homogeneous and heterogeneous systems;
- methods and techniques for production and analysis of low-background materials with a uniquely low content of radioactive impurities, including Inductively Coupled Plasma Mass Spectrometry (ICP-MS) and Inductively Coupled Plasma Atomic Emission Spectroscopy (ICP-AES), as well as other analytical and nuclear spectroscopy techniques.

Methods of nuclear spectroscopy and radiochemistry for studying neutrino properties, searching for dark matter particles, and investigating rare physical processes have long and deservedly proved effective in numerous experiments in fundamental physics and nuclear medicine. The relevance of this topic is certain. The focus on the development of methods and techniques guarantees the scientific novelty of the project expanding the horizons of the experiments performed at DLNP JINR.

Expected results upon completion of the project:*New detectors:*

- detectors based on silicon carbide (SiC) will be designed and then applied to register nuclear radiation; SiC detectors with high radiation hardness and good operability at high temperatures ($> 400^{\circ}\text{C}$) are intended to be used for monitoring the operation of high-current accelerators, nuclear reactors, as well as for diagnostics of hot plasma;
- to search for neutrinoless double β -decay, liquid tellurium-loaded scintillators are expected to be designed and applied, as well as other types of liquid and plastic scintillators;
- composite scintillation detection systems will be developed for neutrino experiments;
- ^3He counters will be developed and applied to the detection of low neutron fluxes (below $10^{-6} \text{ n}\times\text{cm}^{-2}\times\text{s}$); a compact sensitive radon detector will be designed, as well as the technology to produce low-level radioactive components using 3D printing.

It is planned to experimentally study the spectra of low-energy electrons (0–50 keV) with the ESA-50 spectrometer and also the spectra of gamma and X-ray radiation with SCDs during radioactive decay in order to obtain new data on low-excited states of nuclei and post-decay relaxation of atomic systems, as well as to find the ways to perform the spectrometry of post-decay photons (from infrared radiation to soft X-rays) in the energy range of 1–200 eV.

The method for using the codes Geant4, MCNP, and FLUKA to simulate parameters of HPGe spectrometers of the LINAC-200 electron accelerator to determine yields of photonuclear reactions, and of other JINR basic facilities will be developed; in order to investigate rare processes, decay modes of a wide range of radionuclides will be studied, and also their content in samples (^{96}Zr , ^{40}K , ^{138}La , etc.) will be determined.

It is expected that the methods of Perturbed Angular Correlations (PAC) and also Emission Mössbauer Spectroscopy using radioactive tracers ^{111}In , ^{152}Eu , ^{154}Eu , ^{119}Sb , $^{119\text{m}}\text{Sn}$, ^{57}Co , ^{161}Tb , etc. will be mastered in order to study radiopharmaceuticals and their precursors (components) in aqueous systems and other matrices; physicochemical methods for evaluating properties of radionuclides and radiopharmaceuticals in homogeneous and heterogeneous systems will be improved.

Radiochemistry and nuclear medicine:

- sorption processes in various solution–sorbent systems as a chemical basis of methods for purifying radiopharmaceuticals (and low-background materials) are planned to be studied, and radionuclide generators for production of radiopharmaceuticals are to be designed;

- methods for production of radionuclides and their separation (including mass separation) from targets irradiated with protons, neutrons, and gammas for production of radiopharmaceuticals (^{103}Pd , ^{119}Sb , ^{161}Tb , some alpha emitters, etc.) will be developed;
- on the basis of reverse-tandem schemes, the development of a wide range of radionuclide generators will be continued in order to expand the possibilities of producing medical radionuclides; the possibility of producing 1–2 generators of significant activity for external users will be considered;
- methods for radiolabelling radiopharmaceuticals with radionuclides on the basis of chelators with "slow" kinetics will be developed; radium chelation will be investigated.

Methods for producing samples (^{82}Se , ^{96}Zr , shielding materials, solder, etc.) with a new ultra-low content of impurities (from mBq/kg to $\mu\text{mBq/kg}$ of Th and U) will be developed and employed to solve problems in astrophysics and neutrino physics; reverse chromatography will be used, low-boiling and other reagents, prepared or selected, will be utilized, as well as reactor materials, selected and prepared;

- the method for analysing samples at an ultra-low level of sensitivity (mBq/kg – $\mu\text{mBq/kg}$ of Th and U) using ICP-MS, the Neutron Activation Analysis (NAA), and other techniques will be developed and employed; methods for precise determination of chemical and isotopic composition of materials intended for astrophysical and neutrino experiments will be designed.

Expected results of the project this year:

New detectors:

- characteristics of the detectors based on ultra-high purity silicon carbide (SiC) will be determined for spectroscopy of nuclear radiation;
- techniques for producing prototype plastic scintillators based on polystyrene with increased content of the primary scintillation additive and suitable for separating n/γ -radiation by the pulse shape will be fully elaborated and tested;
- technique for producing large-sized plastic scintillators will be fully elaborated and tested; the possibility of introduction of lithium or boron into them will be investigated;
- results of designing composite detection scintillation systems for next-generation neutrino experiments will be obtained; a prototype auxiliary detector for large reactor experiments will be developed; the first results of testing using radionuclide sources will be achieved;
- novel ^3He counter with a low intrinsic background will be tested at the BNO underground laboratory;
- technology for 3D-printing of components of low-level radioactive plastics will be further developed.

Schemes of post-decay photon spectrometers (from infrared radiation to soft X-rays) in the energy range of 1–200 eV will be proposed. The prototype will be tested with radionuclide sources in the range of 1–5 eV.

Experimental data on low-energy electron spectra from the decay of the ^{56}Co , ^{57}Co , and ^{55}Eu radioisotopes with the ESA-50 beta spectrometer are planned to be used to test available computer codes intended for evaluating dose components of Auger and conversion electrons in radiation hygiene and radionuclide therapy. Within the project “Novel method for evaluating detection efficiency in gamma spectroscopy and activity of radioactive sources in real experiments” implemented in collaboration with the Republic of Serbia, instrumental spectra of gamma radiation of the ^{139}Ce and ^{207}Bi radioisotopes will be measured.

Photonuclear reaction yields and cross-sections will be measured, namely the possibility of creating of LINAC-200-based neutron sources using the reactions of ^{197}Au , $^{\text{nat}}\text{Pb}$, and ^{209}Bi will be checked theoretically and experimentally; to study rare processes, decay modes of a number of radionuclides and their content in samples will be specified.

PAC spectrometers are planned to be upgraded, also in cooperation with the NECSA Corporation (Republic of South Africa); new emission Mössbauer spectrometers will be launched using radioactive tracers ^{111}In , ^{152}Eu , ^{154}Eu , ^{119}Sb , $^{119\text{m}}\text{Sn}$, ^{57}Co , ^{161}Tb , etc.

Radiochemistry and nuclear medicine:

The results of studying sorption processes of various solution–sorbent systems, as well as novel schemes of radionuclide production and separation are expected.

Methods for producing samples (^{96}Zr , ^{57}Fe) with a new ultra-low content of impurities to solve problems in astrophysics and neutrino physics will be developed and applied; new experimental data will be acquired.

The methodology for precisely evaluating elemental composition of materials and samples used in experiments with the mass spectrometer (ICP-MS) in radiochemistry, astrophysics, and neutrino physics. The atomic emission spectrometer with inductively coupled plasma (ICP-AES) will be put into operation.

Using rare-earth elements, the yield of isotope separation will be evaluated with the upgraded electromagnetic mass separator YaSNAPP.

The Spectrometry Cluster, the new DLNP JINR basic facility, will get the first experimental data. In its basic configuration, it comprises seven spectrometers based on high-purity germanium, one scintillation detector, and one PAC spectrometer. Also, in collaboration with FLNR JINR, a new cluster facility for alpha-, beta-, and gamma-spectroscopy of long-lived isotopes of superheavy elements will be created.

Volnykh, M.Yu. Vorobyeva, E.A. Yakushev, A.A. Zaikin, I.V. Zhitnikov

Abstract and scientific rationale:

The project combines the experiments DANSS, Ricochet, and vGeN that are studying antineutrino fluxes from nuclear reactors at distances of less than 20 m. The experiments have a common research area, with scientific problems and the ways to solve them, overlapping and coinciding in many respects. Moreover, the same JINR staff and JINR infrastructure resources are involved in this research.

DANSS/DANSS-II are the first and the second stage of the neutrino experiment that uses segmented plastic-scintillator detectors for studying antineutrinos from the VVER-1000 at the Kalinin NPP. The lifting device can vertically move the spectrometer in the online mode, ensuring measurements at the distance of 11–13 m from the reactor. At the first stage of the experiment completed in February 2026, high segmentation of the DANSS detector and also combined active and passive shielding suppress the background down to several percentages relative to the record number of the detected neutrino-like events per day, ~5000. It is expected that the new DANSS-II detector will record 1.5-2 times more useful events.

The vGeN experiment is aimed at studying fundamental properties of neutrinos, in particular, at searching for the neutrino magnetic moment, coherent elastic neutrino scattering (CEvNS), and other rare processes. The vGeN spectrometer is placed under the reactor core of Power Unit 3 at the Kalinin NPP. Neutrino scattering is detected with a specialized low-threshold low-background germanium detector. Active and passive shielding from background radiation guarantees a low level of background in the region of interest while searching for rare events. The detection of events of interest ensures the search for New Physics beyond the Standard Model, and, in addition, can be applied to practical tasks, for example, to design new-generation detectors to monitor the operation of the nuclear reactor using the antineutrino flux.

Ricochet is a new-generation reactor-neutrino experiment aimed at the one-percent-precision measurement of coherent elastic neutrino-nucleus scattering (CEvNS) in the sub-100-eV recoil nucleus energy region, which could reveal New Physics in the electroweak sector. At the end of 2024, the experimental facility was installed near the research nuclear reactor at the Institute Laue-Langevin (ILL). Ricochet will host two arrays of cryogenic detectors: CRYOCUBE (germanium bolometers identical to those developed by the EDELWEISS experiment) and Q-ARRAY (superconducting zinc).

Expected results upon completion of the project:

The main objectives of the DANSS/DANSS-II experiments are the testing of the hypothesis of oscillations of reactor neutrinos into the sterile state and the long-term high-precision monitoring of the operating nuclear reactor by antineutrino flux measurements. In the upgraded facility DANSS-II, it is planned to improve energy resolution and to increase the detector volume, which will allow enhancing the experimental sensitivity to sterile neutrinos. Searching for oscillations into the light sterile neutrino ($\Delta m \sim 0.1\text{--}10$ eV) is one of the trends in fundamental neutrino physics. The existence of sterile neutrinos could explain a number of contradictory observations – first of all, reactor and gallium (anti)neutrino anomalies – and thus simultaneously become a revolutionary discovery of New Physics. Short-baseline reactor experiments (< 30 m) have a number of competitive advantages in this field of research: the huge antineutrino flux from the most intense artificial (anti)neutrino sources available on Earth and the short distance from the radiation source at which the expected oscillation pattern is not smeared yet. It should be noted that the DANSS spectrometer is the leader among facilities of this type.

It is expected that the vGeN experiment will check and specify the parameters of coherent scattering of reactor antineutrinos off germanium nuclei and also over several years of measurements increase the sensitivity to the electron (anti)neutrino magnetic moment to $\sim 1 \times 10^{-11} \mu_B$, which will greatly improve the current best limit. Also, the constraints on the value of the millicharge of electron antineutrinos will be obtained, the charge radius. To search for manifestations of New Physics, the possibility of existence of other rare processes or particles (non-standard neutrino interactions, light scalar and vector mediators, etc.) will be evaluated.

In the Ricochet experiment, according to the elaborated and experimentally proven background model, the statistical significance of the CEvNS detection will be between 7.5 and 13.6 σ . The objective of the experiment is to reach the $\sim 1\%$ -precision. It will increase the probability of discovering New Physics by an order of magnitude in comparison with that of ongoing experiments.

Expected results of the project this year:

DANSS/DANSS-II — To process the full statistics of the DANSS experiment. To launch the DANSS-II detector at the Kalinin NPP. To reconstruct reactor antineutrino spectra on the basis of the DANSS dataset, as well as to study high-energy reactor antineutrino spectra.

vGeN — With the upgraded data-taking system, the experimental setup will continue accumulating data by detecting events at the expected energy threshold of $\sim 200\text{--}250$ eV. This will significantly improve the experiment's sensitivity to CEvNS. Moreover, using the Monte Carlo method, a full model of the background of the experiment will be further developed (primarily the background from fast neutrons).

Ricochet — The first data-taking run, started in 2025 with 18 cryogenic germanium detectors, revealed that the detectors have a median energy resolution of 62 eV and 34 eVee for phonon and ionization channels, respectively. The nuclear recoil detection threshold was 250–300 eVnr, which corresponds to the expected detection rate of 1.8–1.4 coherent scattering events per day. In total, seven reactor ON/OFF cycles are planned to achieve the sensitivity of at least 2σ in the first phase. In the second phase, with upgraded germanium detectors and the silicon detectors currently under development, a sensitivity of 7σ will be achieved in precision studies of CEvNS by 2031.

Abstract and scientific rationale:

The project comprises six main experiments: LEGEND (Large Enriched Germanium Experiment for Neutrinoless double beta Decay), CDEX (China Dark Matter Experiment), SuperNEMO (Neutrino Ettore Majorana Observatory), MONUMENT (Muon Ordinary capture for the NUClear Matrix eleMEnts), Zr-BNO, and Se-LSM. The experiments solve the problems related to searching for different modes of double beta decay and studying them (two-neutrino ($2\nu\beta\beta$) and neutrinoless ($0\nu\beta\beta$)) using nuclear-spectroscopy methods. The detection of double beta decay will allow us to answer the question about the neutrino nature (the process is possible only for Majorana particles) and will undoubtedly indicate the New Physics beyond the Standard Model.

Development of a compact spherical modular muon detector DSTAR (Detection System for Tracking Angular Radiation) based on plastic scintillators and silicon photomultipliers. The detector is designed for the precision measurement of the flux of cosmic muons and their angular distribution, as well as for the development of muography techniques to solve applied problems.

Expected results upon completion of the project:

The LEGEND experiment, the successor of the GERDA and Majorana projects, is designed to search for the neutrinoless

double beta decay of ^{76}Ge ($0\nu\beta\beta$). LEGEND is based on bare detectors of isotopically enriched ^{76}Ge immersed in liquid argon. The experiment is performed in two stages. At the first stage – LEGEND-200 – it is intended to use about 200 kg of ^{76}Ge , with the aim to reach the sensitivity of 10^{27} years over five years of accumulating data. At the second stage – LEGEND-1000 – the measurement will be conducted using 1 tonne of enriched germanium for 10 years. A low background level, high-energy resolution, and efficient discrimination by event topology will ensure the possibility of unambiguous detection of $0\nu\beta\beta$ with $T_{1/2} = 1028$ years.

The CDEX experiment is aimed at the search for neutrinoless beta decay and dark matter at the underground laboratory CJPL using enriched germanium detectors.

The programme of the SuperNEMO Demonstrator includes precision measurements of two-neutrino double beta decay ($2\nu\beta\beta$) and is aimed at reaching the best limits on $0\nu\beta\beta$ for the isotope ^{82}Se .

The objective of the MONUMENT experiment is to measure muon capture by several daughter nuclei, the candidates for $0\nu\beta\beta$ decay.

Within the project, rare double beta decays of several isotopes are investigated. At present, two experiments, Zr-BNO and Se-LSM, are being performed.

The Zr-BNO experiment is aimed at the search for the double beta decay of ^{96}Zr into excited states of ^{96}Mo and at the search for the beta decay of ^{96}Zr into ^{96}Nb using a unique sample of enriched zirconium, produced for the first time in Russia by the centrifuge method.

The Se-LSM experiment is aimed at the search for double beta decay of ^{82}Se into excited states of ^{82}Kr with the low-background spectrometer OBELIX at the underground laboratory LSM in Modane, using the sample of enriched selenium weighing 6.5 kg.

The muon detector DSTAR, comprising 64 scintillator modules, with the unified synchronization system and the system of event formation from coincidences, will be created and tested. The project plans to establish a reference dataset from terrestrial, underground, and deep-underwater measurements; to develop algorithms to solve the inverse problem of muon tomography to reconstruct distributions of matter density; to elaborate the necessary software; and to prepare methodological documentation. Muon fluxes at different depths in Lake Baikal will be measured; underground measurements at the Baksan Neutrino Observatory will be conducted; the muon background will be monitored at the Kalinin NPP and at different depths in natural water bodies.

Expected results of the project this year:

LEGEND — The LEGEND-200 facility will further accumulate the data at the Gran Sasso underground laboratory. Noise and background conditions of the experiment will be optimized. New germanium detectors will be manufactured and tested. At the same time, R&D of argon veto systems for LEGEND-1000 will be performed, and at the Gran Sasso laboratory, the installation of the LEGEND-1000 setup will be prepared.

The spectrometer SuperNEMO Demonstrator will accumulate calibration data. The data on $0\nu\beta\beta$ and $2\nu\beta\beta$ decays in the ^{82}Se nucleus will be obtained. The radon activity of $0.15 \text{ mBq}\cdot\text{m}^{-3}$ will be reached.

CDEX — For the CDEX experiment, the shielding against the radioactive background from ^{42}Ar and other impurities in cryogenic liquids will be designed and manufactured. As part of the neutron background studies at CJPL, new neutron detectors with enhanced sensitivity will be developed, and the first measurements will be performed.

MONUMENT — The activities on the MONUMENT project will be continued. The experimental campaign at PSI with enriched carbon targets (^{12}C and ^{13}C) will be prepared and implemented, including R&D at JINR (testing silicon strip detectors, calibrating, and simulating). Measurements of the muon capture on solid ^{12}C and ^{13}C targets (studies of light nuclei to test theoretical models applicable to double beta decay). Experimental data will be further processed, partial rates of muon capture on ^{136}Ba and ^{76}Se will be obtained, and papers on the total rates will be published.

The TGV spectrometer will be upgraded (detector and electronics). Enriched ^{106}Cd will be measured.

Zr-BNO — The sample of enriched ^{96}Zr will be measured using low-background setups at JINR and BNO.

LSM-OBELIX — The sample of enriched ^{82}Se will be measured using the low-background OBELIX setup at the LSM underground laboratory in Modane. In 2027, a study of β +EC and EC/EC decays of ^{58}Ni to the excited states of ^{58}Fe is planned by measuring a Ni sample with a mass of ~ 21.7 kg containing $\sim 68\%$ of ^{58}Ni . Measurement of background characteristics of the spectrometer and calibration measurements to assess the intrinsic background of the setup.

DSTAR — The data from the first campaign on Lake Onega will be analyzed; preamplifiers will be upgraded and tested in laboratory conditions; a second identical detector will be assembled and its characteristics described; comparative measurements of the two setups will be performed; a new series of underwater measurements at depths to 100 m will be conducted; software for data processing and effective depth estimation will be further developed.

Activities of the theme:

Name of the activity	Leaders	Implementation period
Laboratory Responsible from laboratories		Status
1. Nuclear bolometer of SATURNE project	V.N. Trofimov	2025-2027
		R&D

DLNP A.N. Fedorov, V.G. Kolomic, A.B. Neganov, A.A. Priladyshev, M.Yu. Rykov

Abstract and scientific rationale:

This activity is part of the programme "Study of coherent elastic neutrino scattering off atoms, nuclei, and electrons and measurements of electromagnetic neutrino characteristics with the intense antineutrino tritium source" (SATURNE project: SARov TritoUm neutRiNo Experiment) funded by the Federal Budget of RF and Rosatom. Within this activity, DLNP JINR is involved in developing low-temperature detection systems, namely in manufacturing prototype low-temperature helium and silicon detectors based on the $^3\text{He}/^4\text{He}$ dilution cryostat, and also in studying different ways of generation and detection of elementary excitation pulses in superfluid helium.

Expected results of the activity upon completion:

Data on different ways of generation and detection of elementary excitation pulses in superfluid helium will be accumulated.

Expected results of the activity in the current year:

Commissioning and testing of the JINR-designed cryogenic system based on the dry $^3\text{He}/^4\text{He}$ dilution cryostat with temperature of 20 mK or below. Preparing the manufacture of silicon bolometers: evaporated electrodes, electronics for detecting signals from the thermometric sensor of the detector, selection of the type of the thermometric sensor.

2. DUBTO-2**D.B. Pontecorvo**

2025-2027

Data processing

DLNP I.A. Belolaptikov, V.M. Grebenyuk, S.A. Gustov, A.G. Molokanov, V.A. Panyushkin, A.M. Rozhdestvensky, S.V. Rozov, I.E. Rozova, B.M. Sabirov, S.V. Shvydky

FLNR V.N. Frolov, M.A. Naumenko

Abstract and scientific rationale:

This activity is a follow-up of the projects DUBTO and PAINUC, it means it will be a collaborative experiment of JINR and INFN, Italy, focused on the studies of pion–helium interactions at energies below the Δ -resonance. This experiment will use the data previously obtained at the JINR Phasotron with self-shunted streamer chambers developed at JINR. The goal is to get additional experimental data on the $\pi^+{}^4\text{He}$ interaction at 106 and 68 MeV which is of great value for theorizing and developing models of nuclear matter.

Expected results of the activity upon completion:

Different distributions of kinematic parameters of $\pi^+{}^4\text{He}$ interactions will be obtained, such as momenta and knockout angles of secondaries and invariant masses of two and three particles, in particular the probabilities of different channels of the $\pi^+{}^4\text{He}$ interaction will be specified.

Expected results of the activity in the current year:

Investigating identification of heavy products of $\pi^+{}^4\text{He}$ interactions by analysing kinematics; using the dataset to determine different kinematic distributions (about 1000 three-prong events were detected); preparing the analysis of the statistics on events of $\pi^+{}^4\text{He}$ interactions (about 10 000 one-, two-, and three-prong events); evaluating the possibility of identification of strongly ionizing products of $\pi^+{}^4\text{He}$ interactions by analysing track luminosity.

3. Low-background spectrometers at BNO INR RAS**D.V. Ponomarev**

2026–2028

Implementation
Data processing

DLNP K.V. Antokhina, A.D. Bystryakov, M.S. Dovbnenko, S.A. Evseev, N.S. Gorshkov, S.V. Kazartsev, T. Khusainov, A.V. Lubashevskiy, S.V. Rozov, E.A. Yakushev

INR RAS V.V. Kazalov + 5 pers.

Abstract and scientific rationale:

This activity supports the experiments within Theme 1100. The activity is aimed at creating, maintaining, and developing of the spectrometric JINR infrastructure at the Baksan Neutrino Observatory of the Institute for Nuclear Research of the Russian Academy of Sciences (BNO INR RAS). The infrastructure of this kind will enable studying low-background samples, testing materials used in spectrometric setups for radiopurity, determining the intrinsic background of various detectors and components of measuring facilities, and will pave the way for new experiments searching for rare processes in low-background conditions.

Expected results of the activity upon completion:

New low-background spectrometric detectors and setups will be created; the background of the detectors, manufactured and used at DLNP, will be studied; background conditions of different possible locations for future experiments at BNO INR RAS will be analysed; and materials for low-background experiments will be selected. Properties of neutron detectors will be investigated in BNO conditions of low thermal neutron fluxes.

Expected results of the activity in the current year:

In 2027, a test bench for neutron detectors based on ^3He tubes manufactured at DLNP JINR will be created, and two new spectrometric setups based on low-background HPGe detectors will be assembled.

Condensed Matter Physics (04)

Optical Methods in Condensed Matter Studies

Theme leaders: G.M. Arzumanyan
N. Kučerka

Deputy: K.Z. Mamatkulov

Participating countries and international organizations:
Armenia, Belarus, Egypt, Kazakhstan, Russia, Serbia, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:

Fundamental and applied studies of low-dimensional materials (2D-materials and van der Waals heterostructures) using Raman spectroscopy and upconversion luminescence. Fluorescence microscopy and vibrational spectroscopy in studies of photoactivated programmed cell death (netosis and apoptosis). Spectroscopy of lipid-protein interactions and secondary structure of proteins. Mastering low-frequency Raman spectroscopy.

Tri N.B. Pham

BLTP V.A. Osipov

MLIT O.I. Streltsova

LRB E.B. Dushanov

Abstract and scientific rationale:

Since the first successful isolation of single-layer graphene by mechanical exfoliation of graphite in 2004, two-dimensional materials (2DMs) have attracted much attention owing to qualitative changes in their physical and chemical properties due to the quantum size effect associated with their nanoscale thicknesses. Atomically thin two-dimensional transition metal dichalcogenides (TMDCs), such as MoS₂, WSe₂, and others, exhibit strong light-matter coupling, making them potentially interesting candidates for various applications in electronics, optics, and optoelectronics. They can be assembled into heterostructures, combining the unique properties of their constituent monolayers. Raman spectroscopy is one of the most non-destructive and relatively fast techniques for characterizing such materials, providing high spectral resolution. Vibrational frequencies in the Raman spectrum of low-dimensional materials exhibit characteristic features of the sample, including line shape, peak position, spectral width, and intensity. These parameters provide useful information about physical, chemical, electronic, and transport properties of such materials.

Optical methods of research are also very promising in life sciences. In particular, the combination of vibrational spectroscopy with fluorescence microscopy will allow a detailed study of the mechanisms and signalling pathways of photoactivated programmed cell death – NETosis. Raman spectroscopy is also a fine and highly informative tool in revealing the secondary structure of proteins and is sensitive to lipid-protein interactions.

Expected results upon completion of the project:

Spectral and structural properties of 2DMs synthesized by plasmon-enhanced CVD method.

Mechanism of Raman enhancement effects from analyte molecules adsorbed on two-dimensional materials. Study of their protective properties as applied to biomolecules.

Upconversion luminescence on a low-dimensional platform: studies depending on the sample and excitation wavelength.

Spectroscopic analysis of conformational transformations in the secondary structure of proteins present in various membrane mimetics, including pH and temperature.

Simulation of lipid-protein interaction by MD and DFT.

Identification of mechanisms and signaling pathways of photoinduced NETosis by UV, visible and IR radiation. Identification of primary acceptors of photoinduced NETosis.

Characterization of the effects of simultaneous and sequential exposure to laser radiation on intact neutrophil cells at two different wavelengths.

Raman spectroscopy of ultra-low frequencies $\sim 10\text{ cm}^{-1}$ at different wavelengths of excitation of the Raman signal.

Expected results of the project in the current year:

Spectral and structural properties of 2D materials synthesized via plasmon-enhanced chemical vapor deposition (PECVD).

Upconversion luminescence in low-dimensional systems: studies depending on the sample and excitation wavelength.

Photoinduced modulation of the immune response: a new approach to mitigating the harmful effects of excessive NET formation based on wavelength-selective continuous-wave and flickering light exposure of living cells.

Zamulaeva, N.I. Zhuchkina

Abstract and scientific rationale:

The aim of the project is to study the molecular, genetic and organismal effects of ionizing radiation with different physical characteristics. The use of ionizing radiation of a wide range of linear energy transfer in radiobiological experiments allows obtaining unique information on the nature of the damage to the DNA structure of cells after irradiation, the mechanisms of the induction of gene and structural mutations in cells with different levels of genome organization, and the action of particle radiation on tumor during radiation therapy.

Within the framework of the project, fundamental and applied problems of modern radiation biology will be addressed: the formation and repair of cluster DNA damage in normal and tumor cells following exposure to accelerated charged particles; the study of the radiosensitizing effect of the DNA repair modifier AraC in combination with various molecular biological complexes during irradiation of tumor cells and tissues; the study of the induction of gene and structural mutations in normal and tumor cells following exposure to charged particles; investigation of acute and long-term morphological and functional changes in the mammalian central nervous system following exposure to radiation with different physical characteristics.

Expected results upon completion of the project:

To study clustered DNA DSB formation after exposure to accelerated charged particles of different energies in the nuclei of human skin fibroblasts, tumor cells, and neurons of different parts of the central nervous system of irradiated animals.

To study the repair kinetics of clustered DNA DSB in the post-irradiation period in the nuclei of human skin fibroblasts and radioresistant tumor cells.

To study mechanisms of the radiosensitizing effect of cytosine arabinoside in combination with various molecular biological complexes on normal and tumor cells after exposure to radiation with different LET.

To study quantitatively the survival of normal and tumor cells after radiation exposure in the presence of a combination of DNA repair modifiers.

To continue investigation of point and structural mutation induction in *Saccharomyces cerevisiae* yeast cells by radiation with different LET.

To study the influence of heterogeneity of cell population in haploid yeast on the radiation-induced mutagenesis; estimate mutagenesis in different phases of cell cycle.

To study the influence of respiratory impairment as the result of mitochondrial DNA damage on the sensitivity to the mutagenic effect of radiation.

To study the mechanism of radioresistance and its effect on radiation-induced mutagenesis in yeast mutants.

To continue the study of radiation-induced mutagenesis and to compare the yield of chromosomal aberrations in Chinese hamster cells at the highest and lowest mutagenesis levels depending on the time of expression and LET of accelerated ions.

To analyse structural disorders in the *hprt* gene and their projection on disorders in the chromosome machinery of cells.

To finalise the mFISH study of the biological effectiveness of proton beams.

To study the biological effectiveness of low-energy X-rays following *in vitro* irradiation of human blood lymphocytes using the mFISH method.

To evaluate the contribution of complex chromosome aberrations to the biological effectiveness of densely ionizing radiations following irradiation of human normal and tumour cells *in vitro*.

To study the induction and kinetics of chromatin break repair by premature chromatin condensation in normal and tumour human cells exposed to sparsely and densely ionizing radiation.

To continue the study of primary and late morphological and functional changes in the central nervous system of rats following exposure to ionizing radiation with different physical characteristics.

To conduct studies of pharmacological protection agents' action under ionizing radiation exposure.

To continue the investigation of the activation of microglial cells in cell culture and inflammatory markers in the brain of mice following exposure to ionizing radiation of different quality.

To investigate the possibility to modulate the activation of microglial cells in irradiated culture and neuroinflammation in the brain of irradiated mice by using inhibitors to the receptors of signalling pathways involved in these processes.

To study *in vivo* the radiosensitizing effect of cytosine arabinoside in combination with other molecular biological complexes on melanoma tumor growth in mice following the combined exposure to these agents and proton radiation.

To evaluate the influence of the combined action of AraC and other molecular biological complexes on the survival of different normal and tumor cell lines based on clonogenic survival criterion upon X-ray and proton irradiation.

To study the kinetics of the formation and elimination of DNA damage in U87 glioblastoma and other radioresistant cell cultures after proton and X-ray exposure in the presence of AraC and other molecular biological complexes.

To study DNA DSB formation in different components of the central nervous system after *in vivo* irradiation with protons and X-rays in the presence of a combination of radiomodifiers.

Expected results of the project in the current year:

To continue the analysis of the formation, repair, and structure of complex clustered DNA damage by immunocytochemical staining of the repair proteins γ H2AX, 53BP1, OGG1, and XRCC1 after exposure to accelerated charged particles and X-rays in normal and tumor cells (human fibroblasts, U87 glioblastoma, B16 mouse melanoma, Ehrlich ascites carcinoma, and BxPC-3/PANC-1) and neurons of various parts of the central nervous system (CNS) of animals.

To continue the selection of molecular biological complexes that increase the radiosensitivity of tumor cells in combination with cytosine arabinoside and to study the mechanisms of their radiosensitizing effect on the survival of, and apoptosis induction and DNA damage formation and elimination in, normal and tumor cells *in vitro* and *in vivo* after exposure to ionizing radiations with different physical characteristics.

To continue the mFISH monitoring of cytogenetic effects in patients who received tumor radiotherapy.

To continue the mFISH analysis of karyotypes and genetic stability of normal and tumor mammalian and human cell lines depending on their origin and cultivation duration.

To continue the mFISH study of the biological effectiveness and induced spectrum of chromosomal aberrations in normal and tumor cells of mammals and humans after exposure to ionizing radiations with different physical characteristics.

To continue the analysis of chromosomal aberrations induced in peripheral blood lymphocytes of *Macaca mulatta* monkeys after exposure to accelerated heavy charged particles.

To continue the study of the biological effectiveness and induced spectrum of chromosomal aberrations in normal and tumor cells of mammals and humans after exposure to ionizing radiations with different physical characteristics.

To continue the analysis of long-term memory impairments and pathomorphological changes in the CNS after exposure to accelerated charged particles.

To assess memory and exploratory activity impairments and changes in the electrophysiological parameters of the rat cortex and hippocampus in the long term after local brain irradiation using the SARRP setup.

To continue evaluating the neuroprotective properties of the Nrf2 signaling pathway activator in a mouse model of local brain irradiation.

To continue studying the radiosensitizing effect of Ara-C on tumor growth dynamics in mice using syngeneic models under various fractionation schemes in simulated radiotherapy.

To develop a theoretical model to interpret the spectrophotometric properties of a chemical dosimeter based on ferrous sulfate, benzoic acid, and xylene orange; optimize the composition of this dosimeter based on the developed model and its validation against experimental data; and investigate the dependence of the relative chemical effectiveness of the dosimeter on the linear energy transfer of radiation.

To conduct a comparative analysis of the induction of various types of DNA damage (base damage, single- and double-strand breaks, and clustered damage) at the molecular level in a plasmid DNA model by accelerated charged particles with different physical characteristics.

Using a plasmid DNA model, to continue studying the effect of the concentration of radiation-induced radical scavengers on the DNA damage yield after X-ray exposure.

To continue analyzing the morphological, physiological, and genetic post-flight changes in the properties of microorganisms based on the results of experiments aboard the BION-M2 biosatellite.

Abstract and scientific rationale:

A wide range of JINR's ionizing radiation sources, especially heavy ion beams of various energies, offer a unique opportunity to solve a number of fundamental problems of radiobiology and astrobiology, as well as practical problems related to space exploration and the development of radiation medicine.

Due to the high complexity and cost of performing biological experiments at accelerator complexes, it is of paramount importance to improve experimental methods, ensure dosimetry and radiation safety, and perform relevant computer simulations. The most pressing issues here are the need for experimental reproduction of the energy and spectral composition of cosmic and other types of ionizing radiation, the search for methods for non-destructive analysis of unique samples and automated processing of biological experiment data, as well as the high complexity and resource intensity of computer simulation of processes in living systems.

This project is aimed at solving a complex of the above problems arising in radiobiological and astrobiological research. In the course of its implementation, it is planned to develop new stations for irradiation and dosimetry systems; introduce methods for non-destructive analysis of unique samples; develop and test systems for automated computer processing of biological data; formulate new mathematical models and computational approaches for radiobiology, bioinformatics, and radiation medicine; and identify mechanisms and pathways of the catalytic synthesis of prebiotic compounds under radiation exposure.

Expected results upon completion of the project:

Provision of dosimetry and irradiation of biological samples at JINR accelerators.

Upgrade and commissioning of the GENOME-3 facility.

Development of a multimodal tomography system for small laboratory animals.

Equipping a room for radiobiological experiments using radionuclides.

Creation of a prototype space radiation simulator.

Development and testing of instruments for neutron dosimetry and spectrometry.

Development of an information system for working with experimental data in the form of two-dimensional images, computed tomography data, and video recordings.

Development of protocols for labeling two-dimensional images and video materials, formation of a labeled database.

Testing the implemented analysis algorithms; development and registration of software designed for automated data processing.

Development of mathematical models of the formation and repair of various types of DNA damage and models of the formation of mutations and chromosomal aberrations.

Molecular dynamics modeling of structural and functional disorders in mutant and oxidized forms of proteins.

Development of mathematical models of radiation-induced death of tumor cells and prediction of tumor growth for promising radiation therapy methods.

Theoretical evaluation of radiation-induced disorders of the CNS on the basis of mathematical models of brain neural networks, taking into account damage to synaptic receptors, oxidative stress, and impaired neurogenesis and gliogenesis.

Study of possible pathways of, and conditions for, the formation of prebiotic compounds by irradiation of cosmic matter or terrestrial rocks in combination with the simplest organic molecules.

To conducting structural and elemental analysis of microfossils and organic compounds in various meteorites by nuclear physics methods.

Expected results of the project in the current year:

To continue developing mathematical models of induction and repair of clustered DNA damage of various complexity in normal and tumor cells of mammals and humans in different phases of the cell cycle after exposure to accelerated charged particles with different characteristics.

To continue developing mathematical models of the effect of ionizing radiations in the presence of radiosensitizers on the growth of transplanted tumors in laboratory mice.

To continue developing mathematical models of population growth dynamics for normal and tumor cells exposed to ionizing radiations with different physical characteristics.

To continue developing a mathematical model of chromosomal aberration induction in mammalian and human cells exposed to ionizing radiations with different characteristics.

To continue the molecular dynamics study of the interaction of molecules of promising radiomodifiers with cellular structures such as DNA, membranes, and target proteins.

To continue the study of the relative contribution of local and distributed decay mechanisms of a DNA-associated radionuclide – an Auger electron emitter – to DNA damage induction.

- To ensure the scheduled and service maintenance of the CellRad, XCELL320, and SARRP setups.
- To continue developing software packages to improve calculation methods for determining the physical characteristics of the radiation fields and precision dosimetry for the CellRad, XCELL320, and SARRP X-ray setups.
- To continue improving computed tomography techniques for small laboratory animals.
- Continue improving dosimetry techniques for the Institute's basic facilities: the ISKRA and SIMBO applied research stations, the LINAC-200 facility, and the GENOM-3 setup.
- To ensure conducting methodological and radiobiological experiments at the GENOM-3 setup using heavy-ion beams from the U-400M cyclotron.
- To continue modeling radiation fields during the operation of the ISKRA and SIMBO applied research stations in the Measurement Hall of the NICA complex.
- To continue investigating radiation fields at the Institute's basic facilities using Bonner sphere spectrometry.
- To continue calculations and development of a new wide-energy-range neutron dosimeter based on helium and boron counters.
- To develop and test a passive assembly for generating bremsstrahlung for radiobiological research at the LINAC-200 accelerator.
- To initiate the development of design documentation for a space radiation field simulator for the SIMBO applied research station in the Measurement Hall of the NICA complex.
- To continue studying the processes of fossilization of microorganisms and provide a morphological description of microfossil remains found in meteorites.
- To conduct bacterial paleontological studies of ancient terrestrial rocks and their morphological comparison with findings in meteorites.
- To summarize the accumulated data on carbonaceous chondrites into a monograph.

Study of Molecular Genetic Mechanisms of Adaptations of Extremophilic Organisms

Theme leader: E.V. Kravchenko

Participating countries and international organizations:

Egypt, Moldova, Russia, USA.

The problem under study and the main purpose of the research:

Study of the mechanisms of adaptation of extremophilic organisms to physical and chemical stresses and their use for protection of other organisms.

Project in the theme:

Name of the project		Project leader	Project code
Laboratory Responsible from laboratories			Status
1. TARDISS		E.V. Kravchenko	05-2-1132-1-2021/2028
Protection against physical and chemical stresses with tardigrade proteins			Realization
DLNP	S.V. Apraksina, A.V. Korobeinikova, T.V. Kushelnikova, A.V. Rzyanina, K.A. Tarasov, A.S. Yakhnenko, M.P. Zarubin		
FLNP	O.I. Ivankov, T.N. Murugova		
CAP (FLNR)	E.V. Andreev, A.N. Nechaev		

Abstract and scientific rationale:

Mechanisms of adaptation of living organisms to existence in extreme conditions are of great interest for applied and fundamental research, in particular, mechanisms of resistance to ionizing radiation, high mineralization of the environment, effects of heavy metals, high and low temperatures and high pressure. In view of an increasing level of radiation background due to various man-made contributions, the problem of cosmic radiation, which prevents the long stay of living organisms in space, the need to protect healthy tissues from radiation during radiation therapy of tumors, and a number of general mechanisms underlying cell aging and their damage by ionizing radiation, the study of new mechanisms for increasing radioresistance is one of the most important areas of molecular biology and radiobiology.

Representatives of Tardigrada (tardigrades) belong to the group of animals most resistant to various types of stress on Earth. Tardigrades are able to survive after exposure to both rare and dense ionizing radiation at doses of about 5 kGy.

The Dsup protein is a new protein discovered in 2016 in the tardigrade *Ramazzottius varieornatus*, one of the most radioresistant species of multicellular organisms. Previously, we created the *D. melanogaster* lines and the HEK293 human cell culture expressing this protein, for which a significant increase in radioresistance was shown under exposure to various types of ionizing radiation. For the *D. melanogaster* lines expressing Dsup, the transcriptomic analysis was performed, which revealed the effect of the Dsup protein on a number of processes at the cellular and organism levels. Our results were published in 2023 in iScience (Q1) (<https://doi.org/10.1016/j.isci.2023.106998>). In the experiments to determine the structure of the Dsup protein, the physical dimensions of the Dsup protein molecule were estimated for the first time, some parameters of the DNA-Dsup complex were established, and the existence of a possible secondary structure of the Dsup protein was shown.

The problems to be solved during the implementation of the project are new and important not only for fundamental molecular biology and radiobiology but also for applied areas of biotechnology, space research and other disciplines that require an increase in the level of radioresistance of organisms.

Expected results upon completion of the project:

Creation of a regulated scheme for the expression of the gene encoding the Dsup protein in the *melanogaster* model object to develop a controlled system for the temporary increase in radioresistance of the whole organism.

Evaluation of the effect of the Dsup protein on chromatin compaction in cells to establish the fundamental characteristics of the Dsup protein and map new regulatory elements in the *D. melanogaster* genome.

Obtaining data on the stability and properties of the Dsup protein during exposure to high temperatures and ionizing radiation to evaluate the use of this protein in pharmacology and medicine as a cryoprotectant, preservative and stabilizer for vaccines and other DNA/RNA-containing drugs, and as a protective agent for radio- and chemotherapy.

Development of a technique and a material for purification of nucleic acids from solutions and concentrating DNA and RNA from various biological fluids using the Dsup protein.

Obtaining hybrid molecules of a Dsup-antitumor drug and development of a system for the effective delivery of hybrid molecules to the cell nucleus.

Expected results of the project this year:

Development of a methodology for efficient loading of gold nanoparticles into exosomes using various physicochemical approaches is planned, followed by a comprehensive characterization of the resulting exosomal delivery systems for nanoparticles into cells using transmission electron microscopy (TEM), size-exclusion chromatography, and other methods. The clonogenic assay will be employed to evaluate the survival of irradiated tumor cells that were pre-treated with exosomes loaded with gold nanoparticles. It is anticipated that exosomal delivery of gold nanoparticles into cells, followed by X-ray irradiation, will produce a more distinct radiosensitizing effect compared to free gold nanoparticles due to more efficient internalization of the nanoparticles. This is attributable to the high biocompatibility of exosomes and their ability to enter cells via natural cellular vesicular transport mechanisms (receptor-mediated endocytosis, macropinocytosis, and direct fusion of exosome membranes with target cell membranes), which ensure direct and efficient intracellular delivery of the therapeutic cargo into the cytoplasm.

Atomic force microscopy (AFM) is planned to be used to analyze the structural organization of the Dsup-DNA complex, including measurements of DNA sizes and contour length. In particular, AFM will allow visualization of the distribution of Dsup molecules along the double helix, evaluation of the binding mode (cooperative or uniform), and detection of possible conformational transitions of DNA (bends, loops, condensation), which will provide quantitative characteristics of the physicochemical interaction within the complex.

Initiation of the development of a targeted delivery system for the radioprotective protein Dsup into cultures of normal human cells using exosomal vectors is planned. This will enable subsequent experiments to quantitatively assess the efficiency of intracellular delivery of this radioprotector and the biological activity of Dsup-based preparations *in vitro*.

Methods, Algorithms and Software for Modelling Physical Systems, Mathematical Processing and Analysis of Experimental Data

Theme leaders: S.V. Shmatov
O. Chuluunbaatar

Deputies: N.N. Voytishin
P.V. Zrellov

Participating countries and international organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, CERN, China, Egypt, France, Georgia, Italy, Japan, Kazakhstan, Mexico, Mongolia, Russia, Serbia, Slovakia, South Africa, Tajikistan, United Kingdom, USA, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:

The theme is aimed at organizing and providing computational, algorithmic and software support for the preparation and implementation of experimental and theoretical studies conducted with the participation of JINR, the elaboration, development and use of computational methods for modeling complex physical systems studied within the projects of the JINR Topical Plan. Within the theme, mathematical methods and software, including those based on machine and deep learning algorithms using recurrent and convolutional neural networks, will be developed for modeling physical processes and experimental facilities, processing and analyzing experimental data in the field of elementary particle physics, nuclear physics, neutrino physics, radiobiology, etc. Particular attention will be paid to the creation of systems for the distributed processing and analysis of experimental data and information and computing platforms to support research conducted at JINR and other research centers.

The main areas of work are mathematical and computational physics to support JINR large infrastructure projects, primarily the JINR flagship project NICA in the fixed target mode (BM@N), in the collider mode for relativistic heavy ion collisions (MPD) and polarized beams (SPD), as well as the Baikal-GVD neutrino telescope. Cooperation with experiments at the world's accelerator centers (CERN, BNL, etc.), experiments in the field of neutrino physics and astrophysical experiments, and with radiobiological research programs will also be continued. The possibility of using the developed methods and algorithms within other projects is being considered.

The main direction in modeling complex physical systems, including the states of dense nuclear matter and quantum systems, will be the development of methods, software packages and numerical research based on the solution of the corresponding systems of nonlinear, spatially multidimensional integral, integro-differential or differential equations in partial derivatives with large number of parameters characterized by the presence of critical modes, bifurcations and phase transitions with the complex application of methods of computational physics, quantum information theory and hybrid quantum-classical programming methods.

In addition, the training of specialists in the field of computational physics and information technology within the JINR IT School will be continued.

Abstract and scientific rationale:

The project is aimed at organizing and providing computational support for physics research programs implemented with the participation of JINR, the development of mathematical methods and software for modeling physical processes and experimental facilities, processing and analyzing experimental data in the field of elementary particle physics, nuclear physics, neutrino physics, condensed matter, radiobiology, etc. Particular attention will be paid to the creation of systems for the distributed processing and analysis of experimental data, as well as information and computing platforms to support research at JINR and other world centers.

The main areas of work are mathematical and computational physics to support the JINR large research infrastructure projects, primarily the experiments at the NICA accelerator complex and the Baikal-GVD neutrino telescope. Further cooperation will be continued with the experiments at the largest world accelerator centers (CERN, BNL, etc.), experiments in the field of neutrino physics and astrophysics, radiobiological research programs. The possibility of using the developed methods and algorithms within other megascience projects (CEPC, STCF, etc.) is being considered.

Expected results upon completion of the project:

Revision of interaction generators and their development for simulating interaction processes of light and heavy nuclei, including at NICA energies, production processes of dark matter candidate particles, additional Higgs bosons, and lepton flavor violating processes for LHC and CEPC conditions.

Development of charged particle track reconstruction algorithms for experimental complexes, including at NICA and the LHC, creation of corresponding software and its application for data processing and analysis, the study of the physical and technical characteristics of detector systems.

Elaboration of scalable algorithms and software for processing multiparameter, multidimensional, hierarchical datasets of exabyte magnitude, including those based on recurrent and convolutional neural networks, for machine and deep learning tasks, designed primarily to solve various problems in particle physics experiments, including the NICA megaproject and neutrino experiments.

Creation and development of a data processing and analysis system for the experiments at the NICA accelerator complex.

Development of a data processing and analysis system for event reconstruction in experiments within the JINR neutrino physics program.

Development of algorithms and software for JINR research projects in neutron physics.

Development of algorithms, software, and information-computing platforms for radiobiological research, applied research in proton therapy, and ecology.

Expected results of the project current year:

Elaboration of a simulation program for the elastic scattering of light nuclei for the NICA SPD experiment.

Calculations of spectator neutron and nuclear fragment yields in nucleus-nucleus collisions for the development of a fine-grained detector for small-angle particles.

Analysis of simulated data on collective flows in nucleus-nucleus interactions for the first NICA MPD experiments.

Further enhancement and support of the DCM-QGSM-SMM generator for simulating heavy-ion collisions: inclusion of the Coulomb dissociation of nuclei, accounting for the dependence of the resonance lifetime on the density of baryonic matter, accounting for the deformation of colliding nuclei.

Participation in the BM@N, SRC, and MPD collaborations. Mass generation of various nuclear reactions for the needs of the BM@N, SRC, and MPD detector groups.

Advancement of the SCQM-FCC model. Calculations of nuclear binding energy. Determination of the neutron stability boundary for heavy nuclei. Estimation of the parameters of superheavy nuclei.

Assessment of the systematic uncertainty in lepton and jet reconstruction using 2024 CMS data.

Optimization of selection criteria for dark matter searches within the IDM and 2HDM+a models, determination of the most effective method for identifying dark matter production processes.

Comparison of experimental data and simulation in control regions for the search for dimuon excess using 2024 CMS data.

Completion of the validation of 13 TeV multiparticle correlation analysis by the CMS collaboration. Start of studying multiparticle correlations at 13.6 TeV.

Development and implementation of an algorithm for modeling clusters on the microstrip plane of the GEM tracking detector of the BM@N experiment using generative deep learning networks, including the preparation of a representative sample followed by training a model that takes into account the influence of the magnetic field on signal formation.

Development of a GATNN neural network module for defining the physical parameters of tracks in the SPD experiment.

Development and implementation of a muon identification program into the data processing system of the SPD experiment.

Fine-tuning of the GATNN neural model module with its preliminary labeling on new MPD data, trained to stitch together pieces of tracks broken at the insensitivity points of the TPC detector.

Testing of a number of algorithms for separating overlapping signals using simulated data of responses in the cathode-strip chambers of the CMS experiment.

Software support for the geometry description and reconstruction of the HGCal CMS cassettes of a cold room testbed within the official CMS software package.

Development and implementation of an algorithm for classifying gamma quanta and background events during the registration of extensive air showers in the TAIGA experiment using neural networks and convolutional architectures in order to achieve a background event suppression level of about 10⁻⁵ while maintaining high gamma quanta registration efficiency.

Completion of work on updating the architecture of the Baikal-GVD data processing system.

Publication of updated versions of the SAS, PSD2SAS, FITTER_WEB programs (including the registration of computer programs) and their implementation in regular data processing by users.

Development of a software package for finding a full set of correction parameters for the STS and GEM detectors of the BM@N experiment for new data-taking runs, including the investigation of the stability of the obtained parameters for various facility configurations.

Conducting preliminary research on the development of a software package for the alignment of MPD experiment detectors, including the analysis of the geometric model of the detector system, the determination of requirements for alignment algorithms, and the preparation of software module prototypes for evaluating the precision of reconstruction of the detectors' geometric parameters.

Development of software for the offline reconstruction of MPD experiment data and TPC+ToF reconstruction within the ACTS package.

Implementation of new versions of the geometric and configuration information systems of the BM@N experiment, enhancement of the systems in accordance with user requests, completion of work on creating the DQA system, adaptation of the systems for use in the other NICA experiments.

Performing work to improve the Event Index, CREST, and TDAQ systems of the ATLAS project.

Conducting a study on the organization of a federated SPD data storage system for data centers focused on data analysis (small processing centers).

Implementation of a monitoring system for primary SPD data processing.

Testing of the created system on a full-scale prototype (~3000 CPUs) using simulated SPD data.

Elaboration of an algorithm based on a neural network approach for the task of classifying the trajectory of small laboratory animals in the Morris Water Maze behavioral test.

Development of the MOSTLIT web service by adding new modules to calculate numerical indicators required for radiobiological research.

Elaboration of a web service for the 3D analysis of data obtained at LRB JINR in experiments on studying DNA repair foci.

Development and testing of low-cost sensor calibration methods based on advanced machine learning approaches and quantum neural network models.

Elaboration and development of environmental forecasting methods based on artificial intelligence and Earth remote sensing data.

Development and testing of classification and detection methods under conditions of limited training samples.

Elaboration and investigation of synthetic dataset expansion methods in classification tasks with a limited amount of training data.

Abstract and scientific rationale:

The project aims at the development and use of mathematical and computational methods for modeling complex physical systems studied within the JINR Topical Plan and described by systems of dynamic nonlinear, spatially multidimensional integral, integro-differential or differential equations driven by the parameters of the models. The evolution of the solutions of such systems may be characterized by the occurrence of critical regimes, bifurcations and phase transitions. Mathematical modeling is an indelible part of the modern scientific research. It needs adequate mathematical formulations of the problems within the models under study, the adaptation of known numerical approaches or the development of new ones to effectively take into account the features of the studied physical processes, the elaboration of algorithms and software packages for high-performance simulation on modern computer systems, primarily the MICC MLIT resources. During 2027–2031, the research will be focused on the following main directions:

- I. Development of methods, algorithms and software packages for carrying out numerical studies of interactions of various types in complex systems of nuclear physics, atomic physics, molecular physics, and quantum mechanics.
- II. Studies of intricate processes in condensed matter and materials under external actions.
- III. Solutions of modeling problems in the design of experimental facilities and optimization of their operating modes.
- IV. Modeling of complex processes in dense nuclear matter, including astrophysical models and processes in experimental facilities.
- V. Modeling of quantum systems using methods of quantum information theory and hybrid quantum-classical programming methods.

As a result of the studies conducted by means of the developed methods and software packages, new fundamental information about the investigated physical systems will be obtained, enabling further development of mathematical models for theoretical and experimental investigations at JINR.

Expected results upon completion of the project:

Development of methods and software packages for carrying out numerical studies of interactions of various types in complex systems of nuclear physics, atomic physics, molecular physics, and quantum mechanics.

Methods of the mathematical modeling of nonlinear multifactor processes in materials and condensed media under external actions.

Methods for solving modeling problems in the design of experimental facilities and optimization of their operating modes.

Methods of the computer modeling of complex processes in dense nuclear matter, including astrophysical processes and processes in experimental facilities.

Methods for studying quantum systems using methods of quantum information theory and hybrid quantum-classical programming methods.

Expected results of the project current year:

Development of finite-element methods for solving boundary-value problems for a system of a large number of ODEs to calculate above- and below-barrier fusion reactions of heavy and superheavy nuclei; development of finite-element methods for solving multidimensional (up to 6-dimensional) elliptic boundary-value problems aimed at analyzing collective models of the atomic nucleus; methods for calculating the characteristics of the ionization of atoms from inner shells by fast electrons in electron momentum kinematics, taking into account the distortion of electron plane waves.

Numerical study of the observed physical characteristics of nucleus-nucleus interactions and particle-nucleus interactions over a wide energy range based on microscopic models of the optical potential and transport-statistical models, including nucleon transfer processes and nuclear fragmentation during heavy-ion interactions.

Further development and optimization of the self-similar approximation method for solving nonlinear equations that do not contain small parameters and its application for the analysis of quantum-mechanical systems, including spin ensembles and cold atoms in traps.

Development of tensor network methods and their application to describing the nonequilibrium dynamics of low-dimensional multiparticle quantum systems, including modeling the dynamics of the C_{13} nuclear spin system in a diamond lattice.

Further study of oscillons within the one- and three-dimensional ϕ^4 model based on the combined application of the variational approach and approximation of oscillons by standing waves in a ball of finite radius, with the goal of gaining new insights into the dynamics of oscillons in the high- and low-frequency ranges, their stability, bifurcations, resonance phenomena, and new solution branches.

Further development of a potential quarkonium model with a nonlocal interaction core, and calculation of the mass spectrum, interaction constants, and normalizations with an appropriate choice of form factors and wave functions for heavy quarkonia.

Development of methods and software for calculating collective pion states in dense nuclear matter based on the Migdal and Lindhard functions. Development of algorithms for the analysis of the pion excitation spectrum, pion gaps, and critical parameters for a pion condensate formation over a wide range of densities at zero temperature. Analysis of the accuracy of computational schemes based on the Migdal and Lindhard functions in comparison with other approximations widely used in neutron star cooling models.

Development of a software package for simulating neutron star cooling within various models based on the equation of state of dense nuclear matter, allowing for the existence of several stable configurations of compact stars of equal mass. Numerical modeling of the thermal evolution of neutron stars for cases where the same gravitational mass corresponds to different internal structures of matter. Analysis of the influence of phase transitions in dense matter on the thermal evolution of compact stars.

Development of finite element analysis methods and their application to modeling and predicting the electromagnetic, mechanical, and thermal properties of the new superconductor MgB_2 taking into account the available experimental data, with the aim of assessing its potential use in accelerator magnetic systems.

Study and classification of various sources of adaptivity in the numerical solution of Riemann integrals using artificial intelligence; development of methods for increasing the accuracy of Riemann integral calculations.

Numerical simulation of the interaction of various types of low- and intermediate-energy ions and tungsten targets based on the continuum-atomistic model.

Optimization of a program for simulating beam motion in cyclotrons, including the development of a code for the numerical solution of the corresponding equations of motion using the Boris–Vay method, and a comparative analysis of the accuracy of the fourth-order Runge–Kutta and Boris–Vay methods for the acceleration times of charged particles characteristic of cyclotrons.

Investigation of the dependence of the Shapiro step width on the amplitude of external radiation in the ϕ_0 junction on the surface of a topological insulator. Investigation of the possibilities of controlling the magnetization state in a SQUID based on the ϕ_0 junction on the surface of a topological insulator.

Numerical study of the influence of aperiodic ordering, geometric frustration, and topology on the local superconducting properties of quasicrystalline lattices, including the conditions for the nucleation, suppression, and spatial redistribution of the superconducting order parameter.

Computer modeling of magnetic systems with the aim of finding ways of their optimization, in collaboration with VBLHEP and DLNP, within experiments conducted at JINR.

Detailed review and classification of existing approaches to the decomposition of finite-dimensional quantum systems, constructing a representation of the Weyl–Heisenberg groups and shift operators in a basis adapted to the tensor product structure.

Calculation of quantitative characteristics of the quantum Bernstein effect.

Formulation an efficient scheme for preparing the initial state, trotterization of the evolution operator for the Lindblad equation, and implementation of the corresponding quantum scheme on the NVIDIA cuQuantum quantum simulator.

Investigation of the analytical properties of multiple hypergeometric series arising from the functional reduction of Feynman integrals. Derivation of systems of differential equations for integrals depending on a minimal number of variables.

Enhancement of the robustness of $SU(2)$ quantum gates with respect to external noise by factorizing them into elementary components.

Conducting initial methodological research on the problems of embedding QUBO graphs into the topology of quantum annealers (D-Wave Zephyr). Development and testing of a software prototype of embedding algorithms using the D-Wave Ocean SDK libraries.

Activity of the theme:

Name of the activity		Leaders	Implementation period
Laboratory	Responsible from laboratories		Status
1. Training of specialists in the field of computational physics and information technology		V.V. Korenkov D.I. Pryahina O.I. Streltsov	2027-2029
			Realization
MLIT	A.A. Artamonov, T.Zh. Bezhanyan, O.Yu. Derenovskaya, I.A. Filozova, M.S. Katulin, M.A. Lubimova, E. Mazhitova, I.S. Pelevanyuk, T.M. Solovjeva, V.A. Tarabrin, A.S. Vorontsov, E.N. Voytishina, V.V. Uzhinsky, T.N. Zaikina, P.V. Zrelov, M.I. Zuev		
UC	W. M. Badawy, D.V. Kamanin, N.S. Kiseleva		
Assosiated personnel	A.V. Bogdanov, V.V. Korkhov, Zh.U. Kiyamov, A.N. Nikolskaya, N.L. Schegoleva		

Abstract and scientific rationale:

The training and retraining of specialists in computational physics and information technology on the basis of the Multifunctional Information and Computing Complex (MICC) of the Joint Institute for Nuclear Research (JINR) and its educational components are performed for:

- upskilling JINR staff members in order to develop scientific projects, including megascience ones, which are implemented at JINR or with its participation, as well as to create and support the JINR Digital EcoSystem (DES);
- disseminating competencies in computational physics and information technology to the regions of Russia and the JINR Member States to enhance the personnel potential of JINR and organizations cooperating with the Institute;

Expected results upon completion of the activity:

Holding events for JINR staff members to study state-of-the-art information technologies and opportunities to work on the MICC components and in the DES.

Forming a set of JINR projects in which students can participate.

Forming a list of competencies and required courses for the implementation of projects.

Elaboration of training courses and educational programmes that will provide personnel training for solving a variety of tasks within projects.

Creation of an ecosystem for the implementation of educational programmes on the basis of the JINR MICC, including the cloud infrastructure, the HybriLIT heterogeneous computing platform, which comprises the education and testing polygon and the “Govorun” supercomputer.

Creation of a software and information environment and a platform for organizing and holding events, lectures, workshops, hackathons, etc.

Involvement of specialists from JINR and JINR Information Centres, researchers from the JINR Member States’ organizations, lecturers from leading educational organizations that cooperate with JINR in order to hold educational and scientific events.

Forming event programmes and organizing interaction with universities and JINR Information Centres.

Elaboration of network programs with the participation of JINR partner universities.

Open scientific and educational platform based on a combination of Big Data analytics tools and the ROOT package, including a specialized training polygon, databases of examples with experimental data using hardware computing accelerators.

Expected results of the activity in the current year:

Conducting scientific seminars on information technologies, including for users of the JINR MICC.

Development of training courses and methodological materials on the application of modern information technologies in solving scientific and applied tasks.

Implementation of the educational master’s program entitled “Data Processing Methods and Technologies in Heterogeneous Computing Environments” in direction 01.04.02 Applied Mathematics and Computer Science at the branch of Lomonosov Moscow State University.

Holding the Lomonosov Universiade for students from universities of the Russian Federation in order to discover and support talented youth, as well as to attract them to enroll for the master's course at the MSU branch in Dubna.

Elaboration of a network program for the discipline “Distributed Computing and Cloud Technologies” and its implementation jointly with the Dubna MSU branch and Dubna University.

Holding JINR Schools of Information Technologies.

Training of highly qualified specialists for scientific projects implemented at JINR in collaboration with scientific and educational organizations of the Russian Federation and the JINR Member States.

Conducting educational practices and scientific seminars on information technologies for students from the Russian Federation and the JINR Member States.

Development of the components of the ecosystem on top of the JINR MICC, including the cloud infrastructure and the HybriLIT heterogeneous computing platform, for the implementation of educational programs and the information support of the activity.

Development of the HEPWEB service with the implementation of calculations in the field of high-energy physics using various Monte Carlo generators for evaluating the characteristics of hadron-hadron, hadron-nucleus, and nucleus-nucleus interactions.

Development of the information and training website of the ROOT package with the addition of materials on the work of ROOT within the Big Data pipeline.

Creation of a prototype of an information and analytical portal that integrates thematic news services, educational services, and a service with calculations in the field of high-energy physics using various Monte Carlo generators.

Applied Innovation Activities (07)

Applied Research at NICA in Radiation Materials Sciences, Life Sciences and New Methods of Energy Production

Theme leaders:

O.V. Belov
E.M. Syresin

Participating countries and international organizations:

Armenia, Belarus, Bulgaria, Kazakhstan, Mexico, Moldova, Russia, South Africa, Uzbekistan.

The problem under study and the main purpose of the research:

Obtaining applied research and technology results within the activity areas of the ARIADNA collaboration, including life sciences, biomedical technologies, space research, radiation materials science, radiation hardness of electronics, development of new technologies for ADS using NICA beams.

Project in the theme:

Name of the Project	Projects leader	Project code
Laboratory	Responsible from laboratories	Status
1. ADSR	M. Paraipan	07-1-1107-1-2011/2027
Accelerator driven subcritical reactor		
		Realization
VBLHEP, FLNP, DLNP	see list of activities	

Abstract and scientific rationale:

The project is aimed to determine the optimum beam-converter combination meant to optimize the efficiency of an accelerator driven subcritical reactor. The planned research will proceed in two directions. The first involves the comparative study of the fission distribution and the energy released in enriched fuel blanket, irradiated with proton beams with energy 0.2–2 GeV and ion beams with masses until ^{20}Ne and energies in the interval 0.2–1 AGeV. The second includes measurements of the neutron yield from various converters, irradiated with proton and ion beams.

The possibility of implementing a nuclear system with increased burning capabilities lies in the use of an accelerator driven subcritical reactor (ADSR). It consists of a particle accelerator coupled with a nuclear reactor. The particle beam striking a converter placed in the central part of the reactor provides a supplementary source of neutrons which allows functioning of the reactor in subcritical regime (with criticality coefficient k_{eff} below 0.99), ensuring safer exploitation of nuclear plants. The harder neutron spectrum obtained ensures better incineration of the actinides.

Despite almost generalized opinion that the optimal beam for ADS is a proton beam with an energy around 1–1.5 GeV we have shown in a series of works that ion beams have a superior energetic efficiency than protons. The activities within the project are oriented towards searching for conditions which maximize the energy efficiency of ADSR and ensure high burnup. Within the previous years, aspects related with the core geometry, the material used for the converter, the fuel composition, the working value of k_{eff} , the enrichment and power density distribution were investigated. The influence of the beam characteristics (particle type, energy, beam intensity), and of the accelerator type were also studied. The main conclusions obtained constitute the bases for extending the project in accordance with the stated objectives.

The proposed lead target LETASUR with a central hole for the placement of different converters allows a correct comparison between the neutron yields released with proton and ion beams. Such target is easier to manipulate. The target parameters determined during the project implementation make it possible to characterize the dependence of neutron fluxes on the size of the beryllium converter when exposed to low-energy ions.

Expected results upon completion of the project:

Selection of an optimal design of a target of the ADS.

Verification of a principally new concept of a system based on the use of ion beams instead of protons.

Implementation of the first stage of experimental programme focused on the measurement of neutron yields with different converter combinations.

Expected results of the project this year:

Realization of technical project for the lead target (block with dimensions of 110x110x150 cm, with central hole for the converters and vertical and horizontal holes for the placement of the fission detectors).

Design of the system for the measurement of the beam intensity (ionization chamber and two plastic scintillators for the absolute calibration of the ionization chamber).

Analysis of the experimental method and the determination of the maximal beam intensities depending on the radiation shielding of the experimental room.

Activities of the theme:

Name of the activity		Leaders	Implementation period
Laboratory		Responsible from laboratories	Status
1. R&D within the research topics of the ARIADNA collaboration: experiments in space research, life sciences, biomedical technologies, radiation materials sciences, radiation hardening of electronics and advanced nuclear physics technologies		O.V. Belov	2026-2030

BLTP	V.A. Osipov		

Abstract and scientific rationale:

In 2026, the ARIADNA research programme was launched at the facilities of the NICA complex, designed for applied research. The ARIADNA infrastructure, including beamlines, areas for applied research and zones of user infrastructure, will allow for a number of relevant studies aimed at using accelerated ion beams in space research, life sciences and biomedical technologies, as well as in radiation materials science, radiation resistance of electronics, and modern nuclear physics technologies.

Expected results upon completion of the activity:

Obtaining new data on the interaction of heavy ion beams with various types of materials and biological objects in order to create advanced developments based on modern radiation technologies. Obtaining results on specific structural and functional modifications in the studied samples having different nature after exposure to ions with energies from 3.2 MeV/nucleon to 3.5–4.0 GeV/nucleon.

Expected results of the activity this year:

Conducting the planned runs at NICA in 2027 will allow:

- simulate the impact of individual components of cosmic radiation with the use of beams of NICA facility and radiation facilities of collaborating organizations. Study the combined effects of radiation and other physical and biological factors in experiments on laboratory animals, tissues and cell cultures;
- obtain information on the relative biological effectiveness of heavy nuclei with energies of up to 4.5 GeV/nucleon. To assess the impact of high-energy charged particles on the physicochemical characteristics, redox properties and biological activity (in vitro and in vivo) of rare earth metal nanoparticles in various modifications;
- implement highly sensitive methods for detecting radiation-induced biological damage at the molecular and cellular levels based on the ARIADNA user infrastructure. Conduct a series of experiments to identify specific time profiles of proteins and protein complexes for the repair of double-strand breaks in nuclear (nDNA) and mitochondrial (mtDNA) DNA associated with various types of cancer, and formulate approaches to developing a diagnostic method based on DNA repair markers;
- evaluate the radiation-protective properties of materials in radiation fields generated by the NICA complex for subsequent use as a protection against ionizing radiation on board of space crafts;
- develop the method of radiation modification of various types of polymer compounds using high-energy ion beams. Study the mechanisms of radiation defect formation and release of volatile compounds – suboxides during irradiation of synthetic sapphire and corundum;

- obtain new information on the radiation stability of ultralight highly porous materials based on aerogels and ferrites with different crystal structures in terms of the impact of accelerated ions in a wide energy range. Obtain model estimates for the effect of heavy-ion components of cosmic radiation on ultra-high-temperature ceramics HfB₂(ZrB₂)-SiC;
- obtain new data on the possibility of creating structural and morphological nanosingularities during irradiation of oxide model catalysts with heavy ions in order to tune the activity and selectivity of catalysis;
- perform R&D on the development of analytical devices used for collecting experimental data from biological objects and materials exposed to ionizing radiation.

2. R&D on optimization of methods for irradiating samples of various types; development of the supporting equipment for ARIADNA target stations. Development of laboratory areas for deployment of the user equipment

O.V. Belov

2026-2028

Realization

VBLHEP R.A.Akbarov, V.B. Dunin, E.S. Matyukhanov, Mussa H., M.S. Novikov, V.A. Pavliukevich, N. Puhaeva, A.V. Shemchuk, S.E. Sinelshikova, K.Zholdasbekov

DLNP A.V. Agapov, G.V. Mitsyn, A.G. Molokanov

Abstract and scientific rationale:

A necessary pre-condition for conducting research using modern radiation technologies is the constant improvement of methodological approaches to conducting irradiation sessions and the development of appropriate sample environment systems. In particular, the development of irradiation stands and the development of the necessary equipment in accordance with the tasks of the proposed experiments is of great importance. Carrying out research within the framework of the ARIADNA collaboration, which implies a multi-user mode of operation, requires the creation of sites for the deployment of users' own equipment in order to carry out the process of sample preparation and analytical studies in a short time after irradiation.

Expected results upon completion of the activity:

Creation and development of sample preparation and analytical research areas within the framework of the ARIADNA scientific work program. Manufacture and commissioning of stands and test chambers for studying the combined effect of accelerated ions and other physical factors on material samples and biological objects.

Expected results of the activity this year:

Working out irradiation modes for different samples at ARIADNA applied research stations. Completing the second stage of work on developing the stands and testing the chambers for studying the combined effect of accelerated ions and other physical factors on material samples and biological objects. Studying the effect of ionizing radiation on the main parameters of the resistive-emission layer of the MCP in experiments on heavy ions. Developing a methodology for assessing the integral indicators of the beam intensity and profile for various types of samples studied in the ARIADNA experiments. Developing and testing a detector system for ARIADNA long-term irradiation station. Developing and testing detectors based on fluorescent screens for applied research.

3. Upgrade of spectrum-analytical complex for activation measurements

V.N. Shalyapin

2026-2028

Realization

VBLHEP R. A. Akbarov, D.R. Drnoyan, E.A. Klevtsova, I.A. Kryachko, E.V. Strekalovskaya, Toan Tran Ngor

DLNP V.I. Stegaylov

Abstract and scientific rationale:

Activation of irradiated materials and structural elements of heavy ion accelerators is an important aspect of conducting experiments on irradiation of various types of targets. The spectrum analysis complex of VBLHEP Division No 5 allows for a wide range of gamma spectra measurements, including in flow mode. Gamma spectra analysis using the available spectrum analysis complex will be used as a routine technique in most ARIADNA applied research experiments involving irradiation of samples with accelerated ion beams.

Expected results upon completion of the activity:

Updating the set of detectors of the spectrum analysis complex, the corresponding software and the necessary equipment for carrying out measurements using different types of samples. Extending of works on the development of the database of gamma spectra for ARIADNA experiments.

Expected results of the activity this year:

Updating the detector software; updating the power supplies and the detector central control system. Conducting routine changes to the gamma spectra for applied research at the NICA complex in 2026 beamtime sessions.

4. Software development and dosimetric calculations for ARIADNA experiments. Simulation of radiation conditions at the NICA complex

M. Paraipan

2026-2030

R&D

VBLHEP O.V. Belov, T. Chan Ngoc, V. Javadova, M. Paraipan, A.A. Slivin

LRB A.V. Chizhov

Abstract and scientific rationale:

Software development and dosimetric calculations are an integral part of the preparation of experiments under the ARIADNA scientific program at the NICA complex, as well as an important element of the analysis of dose loads in sessions on irradiation of targets of various types. The use of modern program codes for the interaction of accelerated ions with matter allows planning irradiation sessions using various materials in order to select optimal irradiation parameters and subsequent reconstruction of energy release events in the target material. The data obtained during dosimetric calculations are important input parameters for further studies in terms of structural and functional changes in irradiated samples. An important part of this activity is obtaining modeling of radiation conditions in various parts of the NICA complex using the developed modeling approaches and program codes.

Expected results upon completion of the activity:

Obtaining dosimetric data on irradiation of various types of samples with accelerated ion beams in a wide energy range, including composite materials, as well as other objects with a complex structure and elemental composition. Obtaining estimates of radiation fields for various sections of the NICA complex; calculating the necessary elements of biological protection.

Expected results of the activity this year:

Obtaining estimates of dose loads for samples of composite materials, biological objects and electronic elements when irradiated with heavy ion beams with energies in the range from 3.2 MeV/nucleon to 4 GeV/nucleon. Modeling the interaction of accelerated ion beams with materials in sessions planned for 2026 at the NICA complex. Development of algorithms based on deep learning and computer vision methods, creation of web applications for analyzing data obtained in ARIADNA collaboration experiments to study the effects of ionizing radiation and other factors on biological objects. Calculation of radiation fields in the areas of applied research facilities taking into account the placement of additional user equipment.

5. Studying the mechanisms of radiation modification of superconducting properties in 2nd generation HTSC tapes

M.S. Novikov

2026-2030

R&D

VBLHEP Yu.P. Filippov, E.S. Matyukhanov, M.S. Novikov, A.V. Shemchuk

FLNP A.N. Chernikov

Abstract and scientific rationale:

The aim of the research is to develop methods for increasing the critical current of second-generation HTSC tapes using radiation modification technologies. In recent years, results have been obtained at VBLHEP indicating an increase in the critical current of second-generation HTSC tapes after irradiation with accelerated ions and protons. The discovered effects require further study from the standpoint of creating prototypes of equipment based on radiation-modified HTSC tapes and testing their application in various scientific and practical tasks, including accelerator technology.

Expected results upon completion of the activity:

Obtaining information on the patterns of change in the critical current of second-generation HTSC tapes by radiation modification and mechanical deformation. Obtaining results on the stability of the effect of radiation-induced increase in the critical current of HTSC tapes over time under the influence of various physical factors. Second-generation HTSC tapes. Determining the possibilities of practical application of radiation-modified second-generation HTSC tapes.

Expected results of the activity this year:

Study of radiation-stimulated change of critical current of HTSC composites under special conditions of radiation exposure (presence of background magnetic field and low temperature). Study of properties of irradiated second-generation HTSC tapes during subsequent operation in ionizing radiation fields. Continuation of data taking on structural modifications of HTSC tapes after radiation exposure and mechanical treatment. Calculation of defect formation in HTSC tapes under the influence of charged particles; optimization of radiation defects as magnetic flux pinning centers; calculation of radiation and thermal conditions for a station for rewinding HTSC tapes through a beam of charged particles to create pinning centers.

**6. Organization and maintenance
of the user program ARIADNA.
Development of ARIADNA collaboration**

O.V. Belov

2024-2030

Realization

VBLHEP M.S. Novikov, M. Paraipan, Yu.A. Tsaplina

Abstract and scientific rationale:

Applied research at the NICA complex is carried out in the form of the ARIADNA collaboration, which includes more than 30 organizations from the JINR member countries. The multi-user mode of operation at the NICA complex applied research facilities implies the presence of a coordinated user program that unites the efforts of the ARIADNA collaboration member organizations in obtaining advanced scientific and scientific-practical results. The main task in this area is to coordinate the user program, as well as to create conditions for the coordinated work of user groups during sessions at the NICA complex.

Expected results upon completion of the activity:

Development of a user program for applied research at the NICA complex, ensuring coordinated work of scientific groups from various organizations.

Expected results of the activity this year:

Development of the ARIADNA web portal, including a system for electronic submission of applications for experiments using the NICA complex applied research infrastructure. Testing the multi-user mode of operation on elements of the ARIADNA infrastructure. Maintenance of programs to support the work of scientific collaborations on the NICA complex. Development of scientific programs for organizations joining the ARIADNA collaboration. Ensuring the representation of the ARIADNA collaboration at scientific and scientific-organizational events related to applied research and innovation.

**7. In vivo study of the elemental composition
of bone tissue in degenerative-dystrophic
diseases using the tagged neutron method**

M.G. Sapozhnikov

2027-2029

R&D

VBLHEP V.Yu. Aleksakhin, E.V. Zubarev, Yu.N. Rogov, O.G. Tarasov

FLNP E.A. Razinkov

Abstract and scientific rationale:

Modern bone tissue examination methods, such as osteodensitometry, X-ray computed tomography, magnetic resonance imaging, ultrasound osteodensitometry, and bone metabolism biomarker studies, rely on indirect data on changes in bone structure, architecture, and density in cases of metabolic or endocrine disorders. These methods allow for the determination of bone density and indirect indicators of osteoporosis stages, but the precise elemental composition of bone remains unknown. A method for determining element concentrations in bone in vivo, as well as the dynamics of their changes in bone using the tagged- neutron method (TNM), could facilitate the early diagnosis of various forms of osteoporosis and the differential diagnosis of aseptic necrosis and arthrosis of the articular ends of bones.

Expected results upon completion of the activity:

Development of a methodology for the quantitative assessment of the macro-element composition of bone tissue in vivo in various human musculoskeletal disorders. Development of a tagged-neutron (TN) system for determining the elemental composition of bone tissue.

Expected results of the activity this year:

- Creation of phantoms with a macro-element composition matching standard bone tissue composition for the calibration of

the TNM analyzer;

- Development of an experimental TNM analyzer setup for measuring the elemental composition of biological materials;
- Determination of the elemental composition of bone tissue samples from patients with aseptic necrosis and arthrosis;
- Comparative assessment of results from radiological methods used to examine bone structure and density abnormalities against data on bone tissue macro-element composition.

Radiation Materials Science, Nanotechnological and Biomedical Investigations with Heavy-Ion Beams

Theme leader:

P.Yu. Apel
V.A. Skuratov

Participating countries and international organizations:

Armenia, Australia, Belarus, Kazakhstan, Russia, Serbia, South Africa, Vietnam.

The problem under study and the main purpose of the research:

Experimental and theoretical studies of radiation tolerance of solids to heavy-ion impact, materials testing, controlled modification of materials properties, and the development of new functional structures.

Projects in the theme:

Name of the project	Project leaders	Project code
1. Radiation tolerance of materials to high-intensity beams of heavy ions	V.A. Skuratov <i>Deputy:</i> R.A. Rymzhanov	07-5-1131-1-2024/2028
2. Nanocomposite and functional track etched membranes	P.Yu. Apel <i>Deputy:</i> A.N. Nechaev	07-5-1131-2-2024/2028
3. High-sensitivity sensor based on molecular recognition for viruses detection	A.N. Nechaev E.G. Zavyalova	07-5-1131-3-2025/2029

		Manufacturing

FLNR V.A. Altynov, P.Yu. Apel, I.V. Dukach, N.S. Kirilkin, D.A. Komarova, E.A. Korneeva, V.A. Kuzmin, N.G. Kuzmina, N.V. Kurylev, Le Thi Phuong Thao, N.E. Lizunov, M. Mamatova, A.Yu. Markin, A. Mutali, Nguyen Van Tiep, O.L. Orelovich, E.A. Piyadina, V.K. Semina, A.S. Sokhatsky, V.G. Shmarovoz

Abstract and scientific rationale:

The aim of the project is to accumulate a database for a better understanding of the fundamental laws of high-intensity ionization in model and structural materials. The knowledge of fundamental mechanisms is of paramount importance for nuclear power engineering, nanotechnology applications and for the testing of target materials for nuclear physics experiments. As an innovative approach, it is proposed to study the effects of dense ionization on a previously created defect structure formed by exposure to "conventional" radiation (hundreds of keV and units of MeV, ion irradiation), which is the most reliable way to simulate damage produced by fission products. The main approach to achieving the goals of the project will be the use of modern structural analysis techniques – high-resolution transmission electron microscopy in combination with molecular dynamics methods for modeling track formation processes. Structural changes will be also investigated using scanning electron microscopy, X-ray diffraction, confocal Raman and luminescence microscopy, and the real-time optical spectroscopy under ion irradiation. The radiation resistance of promising reactor materials and target materials for nuclear physics experiments will be investigated by micro- and nanomechanical testing methods.

Expected results upon completion of the project:

Advanced understanding of the fundamental physical laws of high-density ionization in solids based on the studied dependencies of the kinetics of swift structural changes in the tracks of fast heavy ions in the near-surface areas of nanostructured dielectrics – nanoparticles, interfacial layers, and layered structures.

Results of modeling by molecular dynamics methods of lattice relaxation processes and the formation of regions with a modified structure in the near-surface and interphase regions of composite materials exposed to energetic ions – nanoclusters in matrices and layered materials.

Data on the combined effect of dense ionization and helium on the transport properties of fission fragments in protective layers and inert matrices.

Accumulation of a database on the parameters of ion tracks in conventional and nanostructured ceramics promising for nuclear physics applications.

Data on the long-term stability of target materials during prolonged irradiation with intense heavy-ion beams.

Expected results of the project in the current year:

Depth and time-resolved ion- and photoluminescence studies of the optical properties of Al₂O₃ and MgAl₂O₄ single crystals irradiated with swift heavy ions.

Microstructural analysis and micromechanical testing of dispersion-strengthened Fe–Cr–Ni–Co-based high-entropy alloys and high-entropy pyrochlore-based ceramics irradiated with heavy ions of the fission fragment energy.

Modeling of phase transformations in the nanoscale region during irradiation of MgAl₂O₄ and ZrO₂ with swift heavy ions. Interface modification modeling in layered structures by irradiation with high-energy ions.

LRB I.V. Koshlan

Abstract and scientific rationale:

The project’s goal is to develop nanocomposite and functional track-etched membranes (TMs) for applications in nanotechnology, biomedicine, sensor technologies, and novel membrane separation processes. TMs are an example of the industrial application of ion-track technology. They have a number of significant advantages over conventional membranes due to their precisely determined structure. Their pore size, shape, and density can be varied in a controllable manner so that a membrane with the required transport and retention properties can be produced. The modern trends in biology, medicine, environmental research, green energy harvesting, and other areas formulate the demands for membranes with novel specific functionalities. These functionalities can be provided by setting (tuning) the geometry, morphology, and chemical properties of TMs. The present project will focus on the development of various functional track-etched membranes using the following approaches:

- setting the pore architecture;
- composite structures;
- hybrid structures;
- targeted chemical and biochemical modification;
- selection of bulk material.

Special attention will be focused on biomedical applications of track-etched membranes.

The main result of the project will be the creation of scientific and technical foundations for the development of new membranes with specific functions. The applicability of the developed membranes in practically important membrane separation processes, biomedical procedures, and analytical tasks will be investigated.

Expected results upon completion of the project:

Functionalized TMs obtained from ion-irradiated polymer films using soft photolysis and liquid extraction of degradation products from tracks for electrodialysis and the electro-baromembrane process:

- determination of ion-selective properties of membranes;
- investigation of the possibility of mono- and multivalent-ion separation on nanoporous TMs using electrodialysis and the electro-baromembrane process.

Experimental verification of the possibility of manufacturing nanocomposite, functionalized, and hybrid TMs:

- TMs with asymmetric and modified nanopores for the separation of racemic mixtures;
- microfiltration TMs with immobilized proteins for the detection of free RNA and DNA and their use in biosensors;
- functionalized nanoporous membranes made of polyvinylidene fluoride (PVDF) for selective preconcentration of toxic metals and their quantitative determination;
- TMs functionalized with silver nanoparticles and bioactive substances for the creation of bactericidal and viricidal filtration materials;
- modified TMs with improved cell adhesion for cell culture systems;
- affinity ultra- and microfiltration TMs for exosome separation;
- nanocomposite TMs with immobilized silver and gold nanoconjugates and aptamers for the diagnosis of viral diseases using SERS and fluorescence spectroscopy;
- hybrid TMs with surface polymer nanofiber structures and modified selective complex compounds, ligands and metal-organic frameworks for selective removal of toxic metals from water.

Data on ion-selective, electrokinetic, and osmotic properties of modified nanopores, including asymmetric nanopores, depending on their geometry and functional groups on the surface.

Expected results of the project in the current year:

Efficacy evaluation of electrodialysis separation of symmetric and asymmetric (by cation concentration) binary solutions containing lithium and other mono- and divalent cations using PET and PI ‘track-extraction’ membranes.

Optimization of the structural and surface properties of anisotropic porous TMs for diagnostic medical devices.

Development of electrochemical sensors based on PET and PVDF track-etched membranes for detecting uranyl ions in water.

Development of piezoelectric catalysts based on composite track-etched membranes for solving ecological issues in the pharmaceutical industry.

Comparison of the efficiency and reproducibility of the surface-enhanced Raman scattering signal from silver and gold nanoparticles on spike-like and flat track-etched membranes used as elements in aptasensors for rapid and selective analysis of exosomes and viruses.

Study of the optical properties of organometallic coordination polymers based on transition metals (CoII, NiII, CuII, ZnII), L-tryptophan, and 1,2-bis (4-pyridyl)ethylene consolidated on the TM surface.

Optimization of the formation parameters of nanosized coatings deposited on the surface of polyethylene terephthalate track-etched membranes by polymerization in hexafluoropropylene dimer vapor plasma. Investigation of the surface and electric transport properties of Janus-type membranes with asymmetric wettability.

Preparation of nanoliposomes by extrusion and evaluation of the influence of the physical and chemical properties of track-etched membranes on their formation using small-angle scattering.

Investigation of the radiosensitizing effect of cellular exosomes and gold nanoparticles, produced by extrusion, on embryonic cancer cells.

3. High-sensitivity sensor based on molecular recognition for viruses detection

**A.N. Nechaev
E.G. Zavyalova**

2025-2029

Implementation

FLNR V.A. Altynov, E.V. Andreev, P.Yu. Apel, I.V. Blonskaya, N.A. Drozhzhin, I.N. Fadeikina, E.L. Filatova, M.A. Kuvaytseva, A.V. Lundup, A.A. Markin, S.V. Mitrofanov, S.A. Mityukhin, L.G. Molokanova, D.A. Murashko, O.L. Orelovich, U.V. Pinaeva, O.A. Polezhaeva, G.V. Serpionov, D.V. Schegolev, I.I. Vinogradov

DLNP E.V. Kravchenko, M.P. Zarubin

Abstract and scientific rationale:

The purpose of the project is to develop a fundamentally new diagnostic technology characterized by rapid analysis, high sensitivity and specificity, and the ability to adapt for detecting various types of virus-containing analytes. Viruses will be detected using next-generation specialized medical equipment – the Raman luminescent diagnostic complexes. The method is based on the use of nanocomposite track-etched membranes providing surface enhanced Raman spectroscopy (SERS). SERS active track-etched membranes will ensure the selectivity of virus retention in the studied samples and high detection sensitivity. The use of bio-affinity interactions with functional analogues of antibody aptamers labeled by SERS reporters will be an additional factor in the specificity of marker detection. The project will result in the development and experimental justification of a novel biosensor technology for the diagnostics of animal infectious diseases, in particular the African swine fever (ASF) virus. The experimental justification of the hypotheses and the choice of optimal technical solutions will be based on DNA sequencing of ASF and an artificially synthesized enzyme immunoassay reagent – an aptamer capable of immobilizing onto the surface of silver and gold nanoparticles. At the final stages of the work, an experimental test system will be designed for rapid detection of antigens of one of the ASF viruses in clinical material. The project implementation should ensure the achievement of world-class results through the synergistic interaction of specialists in applied nuclear physics, radiation processing of materials, colloidal chemistry, modern biomedical technologies, and microelectronics.

Expected results upon completion of the project:

The result of the project is theoretical and experimental research for the development and production of new functionalized TMs and highly sensitive biosensors for monitoring viruses of various etiologies posing epidemic risks. The main results of the project are the following.

Experimental results related to the analysis of the properties of components for upcoming viral sensors and the possibility of their manufacture:

- TMs functionalized with plasmonic nanoparticles of silver and gold, as well as their alloys;
- synthesis and characterization of aptamers with the highest affinity to the ASF virus and gold and silver nanoparticles;
- nanocomposite TMs with SERS-active ensembles of nanoparticles, with immobilized aptamers for rapid and sensitive detection of viruses (using the ASF virus as an example);
- proof of the efficacy of the developed algorithms for virus monitoring using ASF as an example.

Development and assembly of sensors based on Raman spectroscopy for TM-based viral detection:

- development of an ASF virus analysis protocol using sensors;
- development of diagnostic kits for rapid analysis of ASF;
- development and fabrication of TM-based test strips for selective ASF detection;
- assessment of the possibility of using sensors and test strips with immobilized aptamers for monitoring and diagnosing diseases having social consequences (influenza, coronavirus, hepatitis, oncology).

Expected results of the project in the current year:

A transcriptomic analysis of model cell cultures for identifying biological processes occurred in response to anti-ASFV and anti-EGFR aptamers. A comparison to the intact control.

An analysis of differentially expressed genes followed by functional annotation and identification of molecular mechanisms underlying aptamer-mediated inhibition of viral entry and/or replication.

Development of an electrochemical impedance biosensor for detecting ASFV using track-etched membranes with low pore density and highly specific anti-ASFV aptamers immobilized onto their surfaces.

Estimation of specificity and a detection limit of the SERS-based biosensor fabricated using spike-like membranes covered with thin films of silver and gold and functionalized with aptamers binding to ASFV.

Evaluation of the antiviral properties of aptamer combinations against ASFV and the transmembrane EGFR.

Creation of a Line of High-Voltage Power Supplies and Voltage Switches for Experimental Facilities

Activity leader: D.O. Ponkin

The problem under study and the main purpose of the research:

Development and production of a group of high-voltage power supplies and voltage switches for experimental facilities. The experimental testing sites will be the main VBLHEP facilities: the NICA injector, BM@N, MPD.

Activity:

Name of the activity	Leader	Implementation period
Laboratory Responsible from laboratories		Status
1. Creation of a line of high-voltage power supplies and voltage switches for experimental facilities	D.O. Ponkin	2025-2027
		Development Creation Testing

VBLHEP E.A. Butenko, M.G. Dzugaev, N.A. Malyshev, E.S. Matyukhanov

Abstract and scientific rationale:

It is planned to create a group of programmable electronic modules - high-voltage power supplies and voltage switches for a wide range of technical tasks. The R&D activity is based on the use of the accumulated experience in the development of high-voltage power supplies for the KRION ion sources at the NICA injector. A line of precision DC high-voltage power supplies will be created with an amplitude of 1/3/6/15 kV of both positive and negative polarities, and output currents ranging from a few to tens of mA. It is planned to create high-voltage modules in various designs to expand the spectrum of application areas: a mini-module for internal installation into units, a rack-mount version for a 19' rack (industrial option), and a desktop unit for stand-alone operation.

Expected results upon completion of the activity:

The created line of high-voltage modules and the initial phase of equipment testing conducted under experimental conditions at the operating JINR and partner facilities. Confirmation of the technical specifications for the created devices through bench and experimental tests. Technical documentation developed for the entire line of devices. An approved main test programme and a test protocol for partner facilities.

Expected results of the activity this year:

Comprehensive testing of a group of high-voltage modules:

- controlled mini-module;
- desktop power supply with a display;
- industrial unit in a 19' rack;
- high-voltage switch.

Drawing up test protocols based on the performed tests. Ensuring the specifications of the devices being developed comply with the technical requirements.

Drafting a patent application for the developed solutions.

Creating a software package for controlling high-voltage power supplies.

Development of Deep Tissue Oxygenation Measurement Systems Using Time-Domain Diffuse Optics (TD-DO) Technique

Activity leader: A.S. Selyunin

Participating countries and international organizations:

Russia.

The problem under study and the main purpose of the research:

Modern optical methods, such as time-domain diffuse optics (TD-DO), enable probing biological tissues in the near-infrared range at depths of 3–5 cm; however, their availability is limited by high costs.

The goal of this research is to develop an affordable, compact single-channel TD-DO system for monitoring oxygenation in biological tissues, including the brain.

As part of the project, it is planned to create a source of ultrashort light pulses based on an original generator. Development of a high-precision time measurement system based on an affordable high-speed time-to-digital converter (TDC). Development of a control, data acquisition, processing, and visualization module. Methodological studies of silicon photomultipliers (SiPMs) for efficient single-photon detection in the picosecond time range. Development of control and reconstruction algorithms. Pre-clinical and in-vivo tests to validate the proposed solution.

Activity:

Name of the activity	Leader	Implementation period
Laboratory Responsible from laboratories		Status
1. Development of deep tissue oxygenation measurement systems using time-domain diffuse optics (TD-DO) technique	A.S. Selyunin	2025-2028
		Realization

DNLP N.V. Anfimov, D.V. Fedoseev, Kh. Karatash, A.V. Rybnikov, V.I. Sharov, S.A. Sokolov

Abstract and scientific rationale:

Development of a cost-effective system for non-invasive diagnostics using picosecond pulses of near-infrared and infrared light. This system enables detection of photons that penetrate biological tissues to a depth of 3–5 cm, opening new possibilities for monitoring oxygenation in deep tissues and the brain, as well as for stroke diagnostics. The proposed method may also find applications in other fields, such as environmental studies and food quality control.

Expected results upon completion of the activity:

Development of a portable single-channel system for biological tissue oxygenation monitoring. Preclinical and in-vivo tests have been conducted. The feasibility of scaling up for mass production has been explored. Proceeding to development of a multi-channel functional near-infrared spectroscopy (fNIRS) system.

Expected results of the activity this year:

It is planned to continue the development and refinement of the experimental demonstrator for the TD-DO system. The main research areas will include experimental studies on homogeneous and heterogeneous optical phantoms, a quantitative comparison of experimental data with Monte Carlo simulation results, and the development and testing of reconstruction algorithms for the optical parameters of the objects under study. The results will be used to evaluate the performance of the developed system and to determine directions for its further improvement, including the transition to a multi-channel configuration.

Development of Micro-SPECT Systems for Precision Imaging in Model Biological Experiments

Activity leader: V.A. Rozhkov

Participating countries and international organizations:
Cuba, Russia.

The problem under study and the main purpose of the research:

Single-photon emission computed tomography (SPECT) is one of the key methods of molecular imaging in medicine, widely used in oncology, cardiology, and neurodegenerative disease diagnostics. However, existing SPECT systems have a number of significant limitations, including low spatial resolution (5–10 mm), which hinders the visualization of small anatomical structures and molecular processes; a considerable level of background noise and artifacts caused by the use of conventional collimators; limited detector sensitivity, resulting in prolonged scan times and, consequently, increased radiation dose; as well as insufficient system flexibility, which restricts the ability to adapt the equipment to different types of radiopharmaceuticals and the specific requirements of various studies.

Activity:

Name of the activity		Leader	Implementation period
Laboratory Responsible from laboratories			Status
1. Development of micro-SPECT system for precision imaging in model biological experiments		V.A. Rozhkov	2025-2028
			Realization
DNLP	A. Hassan, R.V. Sotensky		
LRB	G.I. Hernandez		

Abstract and scientific rationale:

The project is aimed at developing a micro-SPECT (single-photon emission computed tomography) system for high-precision imaging of radiopharmaceutical distribution in biological specimens under conditions approximating preclinical research. The primary goal is to create a sensitive and compact system based on Timepix detectors utilizing coded aperture collimators. One of the key features of the proposed system is its cost — an order of magnitude lower than existing commercial alternatives. This technology enables submillimeter spatial resolution, improved gamma photon detection efficiency, and a significant reduction in image artifacts compared to traditional collimation schemes.

The system under development will be adapted for use with a wide range of radiopharmaceuticals commonly applied in nuclear medicine, radiation biology, and related fields. The project includes the creation of a working prototype, its testing in a laboratory environment, and a series of experiments simulating real-world application scenarios. As part of the project, image reconstruction algorithms will also be developed and optimized to enhance contrast and improve the accuracy of small target visualization.

The anticipated results are expected to find application in applied biomedical research, radiopharmaceutical development, evaluation of new diagnostic and therapeutic methods, as well as in fundamental research in radiation biophysics.

Expected results upon completion of the activity:

The final outcome of the project will be a fully functional micro-SPECT system comprising a Timepix-based detector module, a coded aperture system, a mechanical framework for precise positioning of the sample and detector, radiation shielding for personnel, and dedicated software for data acquisition and image reconstruction. The main objective of the development is to create a compact and high-precision device for laboratory studies on small rodents, enabling a breakthrough in the visualization of radiopharmaceutical distribution and facilitating research at an entirely new level.

Unlike conventional SPECT systems, the use of a coded aperture will enable spatial resolution below 1 mm, which is particularly important for studying small animals and complex biological structures.

Expected results of the activity this year:

A micro-SPECT system (mechanical assembly) has been assembled, and the functionality of the mechanical components has been verified.

Testing of Neurotoxicity and Assessment of Contrast Agents, Nanoparticles and Other Compounds Accumulation in Animal Models in TaaS Format

Activity leader: I. Zinikovskaia

Participating countries and international organizations:

Belarus, Russia.

The problem under study and the main purpose of the research:

A key stage in drug development, essential for successful registration and commercialization, is conducting high-quality preclinical studies on efficacy, metabolism, and toxicity in accordance with current standards. These studies can be conducted on the basis of preclinical departments of pharmaceutical companies or, if establishing an internal facility is impractical, be outsourced to specialized organizations providing the relevant services. Within the framework of this activity, it is proposed to organize neurotoxicity testing and evaluate the accumulation of contrast agents, nanoparticles, and other compounds in animal models in the TaaS format within the framework of interlaboratory cooperation.

Activity:

Name of the activity	Leader	Implementation period
Laboratory Responsible from laboratories		Status
1. Testing of neurotoxicity and assessment of accumulation of contrast agents, nanoparticles and other compounds in animal models in TaaS format	I. Zinikovskaia	2025-2028
		Data acquisition and analysis

LRB K.N. Golikova, G.I. Hernandez, I.A. Kolesnikova, I.S. Severiukhin, D.M. Utina

DLNP V.A. Rozhkov

Abstract and scientific rationale:

The proposed activity involves creating an experimental system to evaluate the toxicity and uptake of contrast agents, nanoparticles, and other compounds used in medical diagnostics within the framework of interlaboratory cooperation between FLNP, LRB, and DLNP. This system will integrate the methods, protocols, equipment, and expertise required to study promising diagnostic and therapeutic compounds in small laboratory animals and to develop new technological approaches for nuclear medicine. In particular, a number of ethological and pathophysiological methods will be used to assess the neurotoxicity of new drugs. Neutron activation analysis at the IBR-2 reactor will be employed to determine the accumulation of elements in various organs, which will make it possible to determine their selectivity for tissue structures and conduct a correlation analysis of the relationship between the severity of pathological processes and the metal content in the organ. Tomographic studies will be carried out at the Kalan setup located at DLNP.

Expected results upon completion of the activity:

Interlaboratory testing for neurotoxicity and the assessment of the accumulation of contrast agents, nanoparticles, and other compounds developed in JINR Member States will be organized using animal models in the TaaS format. The system will include stages for evaluating drug efficacy, metabolism, and toxicity.

Expected results of the activity this year:

The neurotoxicity of iodine-containing drugs (including pharmacokinetics, histology, and behavioral tests) will be evaluated in animal models in the TaaS format.

Multifunctional Preparative Tangential Flow Filtration System

Activity leader: I.I. Vinogradov

Participating countries and international organizations:

Russia.

The problem under study and the main purpose of the research:

The development of a multifunctional preparative tangential flow filtration system and the optimization of tangential filtration for micro-, ultra-, and diafiltration of liquids.

Activity:

Name of the activity	Leader	Implementation period
Laboratory Responsible from laboratories		Status
1. Multifunctional preparative tangential flow filtration system	I.I. Vinogradov	2025-2028
Realization		
FLNR	E.V. Andreev, N.A. Drozhzhin, U.V. Pinaeva	

Abstract and scientific rationale:

The research is aimed at developing a multifunctional preparative tangential flow filtration system for micro-, ultra-, and diafiltration of liquids, such as culture media, blood plasma, buffers, and other solutions using flat sheet membranes. Tangential flow filtration systems are widely used in laboratories, industry, and medicine. A multifunctional preparative tangential flow filtration system can be used for various applications, including pharmaceuticals (for the concentration and purification of proteins, vaccines, and antibodies), biotechnology (production of biopharmaceuticals, such as antibiotics and enzymes, and for the removal of endotoxins), food industry (clarification of juices, beer, and other beverages, as well as for purification and stabilization of liquids), winemaking (clarification of wine and other fermented beverages), medicine (purification of infusion and perfusion fluids and drugs), and many other fields.

Expected results upon completion of the activity:

The main result of the research will be the development of a multifunctional preparative tangential flow filtration system that will be used for optimizing tangential flow filtration and for studying physical and chemical interactions between the components of filtered liquids and track-etched membranes, hybrid membranes, and ultrafiltration membranes. Furthermore, the system will be used for investigating the membrane, physical, and chemical processes on the new types of flat sheet membranes; for filtering liquid media in small volumes (filtration process being already optimized) to develop a final product; for concentrating substances in small volumes; and for testing theoretical models of membrane modules for mass production. As a result of the collaborative effort, a single-use module will be developed with the pre-determined filtration parameters, a form factor, materials, and other specific features.

Expected results of the activity in the current year:

Real-world testing:

- work on a protocol for producing modified monoclonal antibodies labeled with radioactive metal isotopes, involving purification and concentration using track-etched membranes;
- work on a protocol for purification of the ascitic fluid of cancer patients, removed during laparocentesis, from disseminating cancer cells by closed tangential flow filtration using track-etched membranes for subsequent concentration and intravenous reinfusion of autologous proteins;
- concentration and purification of silver, gold, silicon oxide nanoparticles, etc.

Lab testing of a single-use module (concentration–filtration of model solutions using ultrafiltration; filtration of model solutions using microfiltration).

Physics and Technology of Charged Particle Accelerators (08)

Development of Scientific DLNP Infrastructure for Research Using Semiconductor Detectors, Laser Metrology, Electrons, Positrons and Cryogenic Technology

Theme leaders: V.V. Glagolev
G.A. Shelkov

Deputy: V.V. Tereschenko

Participating countries and international organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, Czech Republic, Germany, Russia, Serbia, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:

In addition to the Projects highlighted below, the task of particular importance is the complete of commissioning of the basis facility of DLNP – the linear electron accelerator LINAC-200.

The main objectives of the research at the LINAC-200 linear electron accelerator for the upcoming 7-year period are:

- providing electron beams with energies of up to 200 MeV (with a possible increase in energy up to 800 MeV) for research and scientific and methodological work on the creation of detectors of elementary particles at JINR and in scientific centres of the member states for experiments at the NICA collider and other facilities, including those outside JINR;
- study of controlled generation of electromagnetic radiation by relativistic electrons based on the use of functional materials, search for new methods and creation of equipment for beam diagnostics in accelerators;
- carrying out research work on the creation of beams of relativistic electrons with a large orbital momentum;
- implementation of educational programmes of the JINR University Centre;
- conducting research, including applied studies in the field of radiation materials science, radiobiology, radiochemistry.

The expected operating time of the accelerator within the framework of the open user programme will be at least 2000 hours per year.

The goal of the project "Design and development of a test zone for methodological studies of detectors at the linear electron accelerator at DLNP" is to create an infrastructure based on the LINAC-200 for methodological studies using electron beams with energies from 20 MeV to 200 MeV.

Within the project "Precision laser metrology for accelerators and detector complexes", the main objectives are to carry out scientific research and methodological studies on the development of Precision Laser Inclinometers for their application to scientific and applied tasks (monitoring the position of collider elements, improving the accuracy of measurements of Gravity antennas, earthquake forecasting); improvement of methods of metrological measurements; creation of a seismically isolated platform.

The goal of the project "Development of experimental techniques and applied research on monochromatic positron beams (PAS)" is to create a facility to study the structure of various materials and defects arising under various physical influences (aging, external loads, radiation exposure). One of the methods is positron annihilation spectroscopy (PAS). This method is sensitive to the detection of various (so-called "open-volume") defects ranging in size from 0.1 to 1 nm with a minimum concentration of up to 10^{-7} cm^{-3} . The PAS method has four orders of magnitude better spatial resolution compared to the transmission electron microscope.

The main goal of the project "New semiconductor detectors for fundamental and applied research" is the development and methodological study of a new class of physical devices - hybrid pixel semiconductor detectors operating in the mode of counting individual particles. These devices first appeared at the turn of the 2000s and differ from other pixel detectors by the ability to process and digitize the signal directly in the pixel, which makes it possible to obtain data on the energy of each particle falling into an individual pixel in addition to coordinate information.

The goals the project "GDH&SPASCHARM" are the introduction equipment operating at ultra-low temperatures and polarized targets into the practice of physical experiment and conduct of polarization studies and participation in innovative projects using cryogenic, magnetic and polarization technologies.

Abstract and scientific rationale:

Scientific and methodological studies of elementary particle detectors are a necessary condition for the progress of nuclear physics and high energy physics. Preparation of experiments at future accelerators requires new types of detectors capable of coping with large loads and providing the required accuracy and reliability of particle detection. Development of new detectors is also important for applied research based on the use of synchrotron radiation sources and intense X-ray facilities. In particular, creation of new SR sources and super-powerful lasers in the JINR Member States leads to the creation of experimental stations based on detectors with high spatial and energy resolution.

The lack of facilities with test electron beams at JINR significantly slows down progress in development of new types of electromagnetic calorimeters and coordinate detectors for future MPD and SPD experiments at the NICA collider, photon imaging detectors, radiation-resistant detectors and dosimetric instruments. The purpose of the presented project is to create an infrastructure based on the linear electron accelerator LINAC-200 for methodological research on electron beams with an energy of 20 MeV and 200 MeV. It is planned to use a test area based on LINAC-200 and for conducting experiments on the study of photonuclear reactions, for applied research (radiation materials science, radiation genetics, etc.).

Expected results upon completion of the project:

As a result of the implementation of the project, an equipped test zone will appear at the LINAC-200 accelerator of DLNP JINR for carrying out scientific methodological and scientific experimental work by JINR groups and institutes of the JINR Member States.

Expected results of the project this year:

Accelerator operation according to the chosen user applications.

Design and construction of the accelerator second stage (400 MeV electron energy).

Equipping the 200 MeV custom output with narrow-gap proportional chambers to obtain information about particle tracks.

2. Precision laser metrology for accelerators and detector complexes

**V.V. Glagolev
M.V. Lyablin**

2016-2028

Implementation

DLNP I.V. Bednyakov, S.A. Bednyakov, K.S. Bunyatov, Yu.I. Davydov, Yu.V. Klemeshov, S.M. Kolomoets, A.V. Krasnoperov, A.M. Kuzkin, R.V. Ni, A.A. Pluzhnikov, K.D. Polyakov, S.N. Shilov, G.D. Shirkov, V.V. Tereshenko, G.T. Torosyan

BLTP A.N. Baushev

GA&C G.V. Trubnikov

Abstract and scientific rationale:

The implementation of the project is aimed at long-term monitoring of the behaviour of the base of the collider (NICA) to track critical design changes that can cause beam deviations from the calculated orbits. Also, monitoring will make it possible to control angular vibrations of the collider elements from microseismic noise of industrial and natural origin in order to identify sources of noise and frequencies that coincide with the resonant frequencies of the collider elements, which can lead to a decrease in luminosity.

An equally important component of the project is development of a compact inclinometer capable of measuring changes in the angles of inclination of the surface with an accuracy of about 10^{-8} radians throughout the year, and further, building of a network of such inclinometers in seismic regions to determine energy accumulation zones and potentially seismic areas.

Expected results upon completion of the project:

Use of small-sized precision laser inclinometers (MPLI) to monitor the behavior of the bases of the NICA collider focusing elements in the MPD hall. Tracking seismic noise and changes in the base position of these elements due to external man-made and natural influences.

Research and development to develop a new version of the MPLI – an interferometric PLI (IPLI), which has a weak temperature dependence and is less expensive to manufacture, based on readily available components.

Placement and commissioning of the PLI at the Naroch Geophysical Observatory of the Geophysical Monitoring Center of the National Academy of Sciences of Belarus. Conducting joint measurements using industrial geophysical sensors and inclinometers of the Laboratory of Nuclear Problems; processing of measurement results.

Installation of the PLI in Kamchatka, at the observatory of the Unified Geophysical Survey of the Russian Academy of Sciences (KB FRC EGS RAS) and at the Kamchatka State University. Vitus Bering KamSU (Vitus Bering KamSU). Conducting joint measurements.

Conducting research and development to develop a new version of an inclinometer with signal acquisition using a video matrix.

Conducting the initial stage of establishing a joint geophysical experimental station between JINR and the Geophysical Monitoring Center of the National Academy of Sciences of Belarus at the JINR Laboratory of Nuclear Problems.

Expected results of the project this year:

Monitoring the behavior of the NICA collider focusing element bases in the MPD hall.

Manufacturing and testing prototypes of an interferometric inclinometer and an inclinometer with data acquisition using a video matrix.

Creation and installation of an improved PLI design at the Naroch Geophysical Observatory in Belarus for long-term testing.

Completing the initial stage of the creation of a joint geophysical experimental station between JINR and the Geophysical Monitoring Center of the National Academy of Sciences of Belarus at the JINR Laboratory of Nuclear Problems.

3. Development of experimental techniques and applied research with slow monochromatic positron beams (PAS)

A.A. Sidorin
Scientific leader:
I.N. Meshkov (VBLHEP)

2016-2028

Implementation

DLNP E.V. Akhmanova, V.I. Hilinov, Nguyen Vu Minh Trung, O.S. Orlov, E.P. Popov, A.Yu. Rudakov, S.F. Samedov

VBLHEP V.V. Kobets

Abstract and scientific rationale:

Applied research in the field of solids by PAS methods and the development of experimental techniques using these methods are among the goals of the project. To study defects in materials, the annihilation line Doppler broadening (DBAL) method is used, which is implemented on a flow of slow monochromatic positrons. The DBAL spectrometer is made according to the standard scheme. The Positron Annihilation Lifetime Spectroscopy (PALS) method implemented on an autonomous ^{22}Na source is also used. To develop the experimental base, the PALS method is being introduced on a flow of slow monochromatic positrons. The group proposed an original version of this method based on the formation of an ordered stream of slow positrons.

Expected results upon completion of the project:

Improvement of the DBAL spectrometer by adding to the measurement scheme the possibility of registering the coincidence of two annihilation gamma quanta.

Completion of the positron ordering system and commissioning of the PALS spectrometer on a monochromatic positron beam.

Development of the ion etching technique using the created etching system and its application to the study of thin-film multilayer materials.

There is a problem of high-temperature vacuum heating, which can be solved by heating samples with an electron beam. The available technical capabilities make it possible to implement this heating method.

Expected results of the project this year:

Study of various materials (semiconductors, metals, alloys, polymers, thin films) using beam-based DUAL and PALS (in the conventional implementation).

Continuation of applied research in collaboration with TPU (Zr/Nb layered materials), NArFU (synthetic diamonds), Vietnam (BiVO₄, layered materials for solar panels), and South Africa (synthetic diamonds).

Study of materials and thin films using the DUAL coincidence method.

Use of ion etching to improve measurement accuracy and sample depths greater than those available with the PAS facility.

Testing of the PALS ordering system using a positron beam and conducting test measurements.

Improvement of the automatic control system for the PAS facility.

4. Novel semiconductor detectors for fundamental and applied research

G.A. Shelkov
Deputies:
V.A. Rozhkov
V.V. Tereschenko

2015-2028

Implementation

DLNP S. Abdelshakur, N.N. Kaurtsev, V. Kruchonok, A.V. Lapkin, G.K. Lavrov, S.A. Malinin, V. Makarova, R.V. Sotensky, Phi Truong Hoai Bao

FLNR A.T. Isatov, S. Mitrofanov, Yu.G. Teterev

FLNP A.A. Ahmedov, D. Berikov, Yu.N. Kopach

LRB A.N. Bugay, A.V. Chizhov

Abstract and scientific rationale:

In 2015, theme 1126 was opened. The main goal of the work is the development and methodological research of a new class of physical devices - hybrid pixel semiconductor detectors operating in the single-particle counting mode. These devices first appeared at the turn of the 2000s. and differ from other pixel detectors by the ability to process and digitize the signal directly in the pixel, which makes it possible to obtain data on the energy of each particle falling into an individual pixel in addition to coordinate information.

The ability to measure the energy of an X-ray gamma ray opens up new possibilities that were previously unavailable. Having such information, you can determine not only the absorption capacity of individual elements of the object under study, but also determine the material of this element. Thus, in medical X-ray tomographs, the identification of substances in individual parts of a living organism provides vital information about metabolic pathways, tissue components and delivery mechanisms of these substances. This task is of particular importance when studying drug delivery. Carrying out such studies using X-ray computed tomography (CT) is currently difficult due to the lack of available detection systems with high spatial resolution and capable of measuring the energy of gamma rays. The goal of this project is to create a hardware and software basis for the development of detection systems with hybrid pixel detectors and radiographic medical and industrial equipment based on them. As a result of the project, prototypes of new energy-sensitive pixel detectors will be developed and manufactured in industry.

Expected results upon completion of the project:

The main direction of further work will be the development of our own ASIC and the production of new energy-sensitive semiconductor X-ray image detectors and equipment for:

- creating a hardware and software basis for the development of new types of X-ray devices for medical and industrial diagnostics, including computed tomography;
- improving methods for identifying substances in x-ray studies using data on the measured energy of gamma quanta.

Expected results of the project this year:

Manufacturing and testing of the first elements of the developed ASIC.

Creation of a prototype system for read-out data for pixel detectors.

Continuation of joint work with chemists from Moscow State University on the MARS microtomograph.

5. GDH&SPASCHARM

Yu.A. Usov

2011-2028

Implementation

DLNP	A.S. Dolzhikov, A.N. Fedorov, I.V. Gapienko, I.S. Gorodnov, V.L. Kashevarov, A. Kovalik, E.S. Kuzmin, A.B. Neganov, A.A. Priladyshev, Yu.N. Uzikov, V.P. Volnykh
BLTP	S.B. Gerasimov
VBLHEP	V.V. Fimushkin, M.V. Kulikov, L.V. Kutuzova

Abstract and scientific rationale:

Experimental study of one-spin asymmetries in the production of various light particles using a pion beam with an energy of 28 GeV at the first stage, and the study of one-spin and two-spin asymmetries in dozens of reactions, including those with the formation of charmonium, using a polarized proton beam (SPASCHARM project).

The ultimate goal of the SPASCHARM project is to study the spin structure of the proton, starting with determining the contribution of gluons to the spin of the proton at large values of the Björken variable x by studying the spin effects in the formation of charmonium. This will make it possible to understand the hadronic mechanism of charmonium production and to isolate the gluon polarization $\Delta g(x)$ at large values of x.

Experiments with a real photon beam: photoproduction of mesons on nucleons and nuclei and Compton scattering on nucleons. Main objectives: experimental confirmation of the Gerasimov-Drell-Hearn (GDH) sum rule, investigation of the helicity structure of partial reaction channels, resolution of the excitation spectrum of baryons from light quarks, search for missing baryon resonances and exotic states (dibaryons, narrow nucleon resonances), study of the structure of hadrons.

Measurement of $\Delta\sigma_T$ and $\Delta\sigma_L$ in an experiment on the transmission of polarized neutrons through a polarized deuteron target at neutron energies <16 MeV, where there are limited experimental data and where theory predicts a significant effect of three-nucleon forces (3NF). This part of the project (NN) is a continuation of measurements of the same quantities in the scattering of neutrons by protons, which were carried out earlier.

Research and development of polarization equipment for MESA.

To date, there is no theory that gives a complete and consistent description of all the observed polarization effects in the hadronic sector. Therefore, a systematic experimental study of polarization effects in a wide variety of reactions using polarized beams and polarized targets is of great importance for the development of a theory that consistently describes all the observed spin phenomena.

The observed polarizations are the paramount characteristics of the interactions of elementary particles and nuclear reactions. Formally, the measurement of spin-dependent parameters imposes additional restrictions on the proposed reaction mechanism, the structure of the microobject under study, and the very nature of the fundamental interaction. It should be noted that modern experiments aimed at searching for the effects of CP violation and T invariance violation outside the Standard Model, as well as CPT violation, are based on polarization measurements.

Expected results upon completion of the project:

Development and construction of a new cryostat for a polarized "frozen" target of the SPASCHARM installation.

Completion of work on the creation of a cryostat for a polarized target at the University of Bonn.

Return transport and full launch of the polarized target in Mainz for the GDH project.

Carrying out polarization studies using a polarized "frozen" target at the MAMI-C accelerator.

Carrying out polarization studies on a new polarized target at the Bonn University accelerator ELSA.

Launch of the modified polarized target of the SPASCHARM facility and the beginning of the collection of physical statistics on the accelerator.

According to the NN-interaction program, channeling experiments will be carried out after the upgrade of the stand for the source of polarized deuterons – 2024-2025.

Carrying out precise measurements of vector and tensor polarizations of the deuteron beam at the VdG accelerator.

Preparation of a special device for using a new target material based on trityl-doped butanol.

Manufacture and installation of equipment for measuring polarization of neutrons using scattering on a ^4He target.

Depreservation of the polarized deuteron target and the beginning of measuring the difference between the cross sections $\Delta\sigma_T$ and $\Delta\sigma_L$ in the experiment on transmission of at neutron energies <16 MeV.

Expected results of the project this year:

Complete creation of a new cryostat for a polarized target at the University of Bonn.

Participation in the physical data taking at the ELSA accelerator.

FLNP	A.N. Chernikov

Abstract and scientific rationale:

The project is aimed at creating the medical superconducting cyclotron MSC-230 and the infrastructure for radiobiological studies. The project implementation will allow continuing at a new level the research in proton-beam therapy, conducted with proton beams of the Phasotron at DLNP JINR over decades. The planned high intensity of the proton beam — with the maximum current of 1 μA in the continuous mode and of 10 μA in the pulsed mode — will allow to research the new FLASH therapy method.

It is necessary to simulate and test prototypes elements of the cyclotron, such as the superconducting coils, the proton source, and the deflector for successful commissioning of the MSC-230.

The development of MSC-230 superconducting proton cyclotron will create a source of intensive proton beam, opening up possibilities for modernization of equipment for precise control and high dose rate for FLASH therapy method studies. The research in the field of proton radiation therapy, which was carried out for many years on proton beams of Phasotron at DLNP JINR will continue. Due to the planned high intensity of proton beam on the new accelerator it is possible to implement a transition to the so-called FLASH therapy. FLASH radiation is performed at a high dose rate (40 Gy/s) for a very short time (10-50 ms). This radiation method significantly reduces the damage to the healthy tissue surrounding the radiated tumor. There are no proton beam therapy centres in the world that can implement this radiation technique currently.

The proton cyclotron MSC-230 will implement: the conduction of the broad-spectrum radiobiological studies; improvement of the efficiency of irradiation by protons using the heavy metal nanoparticles; practical challenges of space radiobiology; enhancing radiation protection systems of spacecraft for near-Earth pilot flights; development and calibration of new detectors for the space industry; study of effects of ionizing radiation on animal behavior (monkeys, rodents).

The proton cyclotron MSC-230 will implement of the breakthrough R&D in the field of superconducting magnetic technologies for accelerators of the future, including technologies based on high-temperature superconductors (HTSC), ultracompact cryogenic supply systems, use artificial intelligence (AI) technologies in the modeling of cyclotrons for applied purposes, irradiation planning and radiobiology. To implement artificial intelligence (AI) technologies in the simulation of cyclotrons for applied purposes, irradiation planning and radiobiology.

Expected results upon completion of the project:

Creation of the medical superconducting cyclotron MSC-230 and infrastructure for radiobiological research. Radiobiological studies, medical certification of the proton beam and dosimetry equipment.

Expected results of the project this year:

The MSC-230 commissioning. Manufacturing of the transport channel and treatment room with a control panel.

2. Technological Positron Annihilation Spectroscopy Complex PASTech		S.L. Yakovenko <i>Scientific leader:</i> G.V. Trubnikov	2026-2027
			Implementation
DLNP	A.V. Agapov, E.V. Ahmanova, S.B. Fedorenko, D.A. Fedorov, V.I. Hilinov, A.B. Maslennikov, M. A. Nozdrin, O.S. Orlov, R.V. Pivin, A.Yu. Rudakov, A.A. Sidorin		
VBLHEP	V. M. Drobin, O.A. Hilinova		

Abstract and scientific rationale:

To study the structure of various materials and defects arising from physical influences (aging, external loads, radiation exposure), high-precision methods are required capable of distinguishing heterogeneities in the crystalline structure at the nanometer level. One of the methods of this kind is the Positron Annihilation Spectroscopy (PAS). This method allows detecting various so-called "open-volume" defects ranging in size from 0.1 to 1 nm with a minimum concentration of up to 10^{-7} cm^{-3} .

Monoenergetic positron beams are of great interest in materials science. With a monoenergetic low-energy positron beam, it is possible to scan a sample from the surface to a depth of several tens of microns by adjusting the energy of positrons.

Thus, a positron monoenergetic beam can be used for PAS studies of characteristics of thin films, for the analysis of surface modification, for the investigation of near-surface layers of materials, and the structures commensurable with the depth of positron penetration.

A compact facility for solid-state research with PAS methods has been developed and is successfully operating at the Joint Institute for Nuclear Research. The team that have designed and now operates the facility has the scientific and technical expertise to create a unique technological positron annihilation spectroscopy complex, PASTech.

The aim of the project is to create a preproduction prototype: a compact and unique complex for conducting solid-state research using PAS. The following design parameters are to be obtained: the positron beam intensity of $10^6 \text{ e}^+/\text{s}$, the spectrum width less than 2 eV, the energy range from 30 eV to 3 keV with a 30-eV step.

In JINR Member States and at Russian educational centers, there is currently a great demand for compact facilities capable of conducting applied research in materials science, as well as of training engineers in accelerator technology.

The modern technological complex using PAS methods will both enable solid-state research and create an experimental base for education representing a compact particle accelerator with the majority of common accelerator systems (vacuum system, magnet system, beam diagnostics, cryogenic technology, control system, etc.)

Expected results upon completion of the project:

The result of the project is a modern functioning complex that requires minimum staff, has regulations of operations, protocols, certificates, and service support.

Expected results of the project this year:

The purchase of equipment, the manufacture of the main units of the facility. The assembly and commissioning. The design parameters will be achieved. The set of maintenance and design documentation will be prepared.

Activities of the theme:

Name of the activity		Leaders	Implementation period
Laboratory			Status
1. Further development of methods, technologies, schedule modes and provision of radiotherapy		G.V. Mitsyn	2024-2027
			R&D
DLNP	A.V. Agapov, K.V. Belokopytova, S.N. Dima, G.V. Donskaya, V.N. Gaevsky, S.A. Gustov, M.D. Indiukova, I.I. Klochkov, A.G. Molokanov, S.A. Pisareva., A.V. Rzyanina, S.V. Shvidkiy, S.S. Uglova		

Abstract and scientific rationale:

This project is a continuation of the medical and biological research started at the JINR Laboratory of Nuclear Problems in 1967 using proton beams. The project includes the following works: participation in the determination of medical and technical conditions for the project to create a proton therapy center, calculation of beam transportation channels to the irradiation units, development and manufacture of the detectors for dosimetric support of FLASH therapy, development and testing of all technological stages of planning and conducting proton therapy. It is planned to conduct medical and biological research at the DLNP linear electron accelerator (LINAC-200), which is supposed to form an electron beam with an energy of 20-25 MeV for irradiating cell cultures and small laboratory animals (mice, rats).

Expected results of the activity upon completion:

The manufacturing and testing of proton beam Bragg peak modifiers (comb filters) using 3D-printing for the future radiological center based on the MSC-230 accelerator. Manufacturing and testing of thin-walled multi-wire and strip ionization chambers. Formation of an electron beam with an energy of 20-25 MeV on the LINAC-200 accelerator for medical and biological research.

Expected results of the activity in the current year:

The manufacturing and testing of proton beam Bragg peak modifiers (comb filters) using 3D-printing for the future radiological center based on the MSC-230 accelerator. Manufacturing and testing of thin-walled multi-wire and strip ionization chambers. Formation of an electron beam with an energy of 20-25 MeV on the LINAC-200 accelerator for medical and biological research.

2. R&D of Photoinjecting systems	M.A. Nozdrin V.V. Kobets	2024-2027
		Technical Proposal Realization

DLNP A.S. Dyatlov, V.V. Orlov, K. Popov, A.G. Sorokin, D.S. Shokin, A.I. Verenich, K.E. Yunenko

VBLHEP V.V. Bleko, N.I. Garanzha

Abstract and scientific rationale:

The most modern free electron lasers, as well as other facilities which require high quality electron beam, the photocathode injectors are being used. Such injectors allow to obtain higher beam quality than thermoemission ones. Replacement of the thermoinjector of the LINAC-200 accelerator to the photoinjector is being considered. This will result in the beam emittance reduction, will give more flexibility in beam temporary profile and eventually will allow to construct LINAC-200-based FEL in the range from far IR to UV and soft X-rays.

Expected results of the activity upon completion:

The photoinjector testbench with the electron energy of up to 6 MeV based on S band RF gun construction.
The possibility of replacing the thermoinjector of the LINAC-200 accelerator with a photoinjector to improve beam quality and variability of its parameters conclusion.
Research of the quantum efficiency of various "transparent" photocathodes based on ultra-thin carbon films: depending on deposition method, carbon phases and structures, doping elements and their concentration, cathode shape etc.

Expected results of the activity in the current year:

Finish of the bench RF system upgrade. Implementation of the laser-clock based klystron operation, phase-locked loop system proposal and development start. Finish of the laser driver upgrade. Finish of the safety systems development. Start of the bench commissioning.

3. Participation in the development of the concept and joint project with FMBA of Russia for the creation of a pilot scientific and clinical center for proton therapy	G.D. Shirkov	2024-2028	Preparation of project

DLNP S.G. Shirkov, S.L. Yakovenko

VBLHEP L.Yu. Stolypina

Abstract and scientific rationale:

The Federal Medical and Biological Agency (FMBA) of Russia expressed its intention to take part together with JINR in the development of a joint concept (and in the future, a project) for the establishment of a pilot scientific and clinical center for proton therapy on the basis of the existing medical center №9 of the FMBA in Dubna and based on the MSC-230 accelerator being created at JINR. The objectives of the center will be development of modern methods and technologies of radiation therapy, medical technologies and diagnostics for the use of radiation therapy, advanced scientific research in the field of radiobiology, experimental irradiation and further treatment of patients.

Expected results of the activity upon completion:

Preparation of the project for establishment a proton therapy center.

Expected results of the activity in the current year:

The technical design of the proton therapy center.

Analytical and Methodological Developments for the Organization of Scientific Research and International Cooperation in the Main Directions of JINR Development

Theme leaders:

V. A. Matveev
S.N. Nedelko
O.-A. Culicov

Participating countries and international organizations:

Armenia, Bulgaria, Egypt, Kazakhstan, Russia, South Africa, Tunisia.

The problem under study and the main purpose of the research:

Development of analytical materials concerning prospects of scientific research.

Preparation of scientific research plans. Development of science-organization and methodological materials for the special-purpose financing of research areas, themes and projects.

Development and application of information systems for the analysis of results of theoretical and experimental research.

Organization of international cooperation with the Member States of JINR, with states participating in JINR activities on the basis of bilateral agreements, and with scientific research institutions with which JINR has collaboration agreements.

Expected results upon completion of the theme:

Recommendations on the main areas of activity and development of JINR.

Analysis of scientific and technical cooperation and scientific and organizational activities of the laboratories and divisions of the Institute.

Scientific and organizational support for the process of developing plans and reports for research and international cooperation at JINR.

Ensuring operational interaction with representatives of JINR Member States and states participating in JINR activities on the basis of bilateral agreements in the field of scientific research.

Expected results of the theme in the current year:

Improvement of the organization and coordination of JINR scientific research work.

Analysis of the results of JINR activities for 2026 in the main research areas.

Preparation for the publication of the Topical Plan for the year 2027. Identification of JINR's priority research directions for 2028. Update, administration and support of the electronic system for maintaining the Topical Plan for JINR Research and International Cooperation (Topical Plan).

Development of JINR's grantmaking activities and participation in special-purpose programmes for financing scientific research in 2027.

Preparation of analytical materials for ministries and agencies of Member States.

Development and promotion of JINR's information resources on the Internet. Ensuring the operation of the official JINR website.

The publication of the JINR weekly newspaper "Dubna: Science, Cooperation, Progress" and the quarterly publication of the bulletin "JINR News".

Support for the system of concluding and recording agreements on scientific and technical cooperation.

Promotion of realization of JINR's right to independently confer academic degrees of Russian Federation. Support of the operation of JINR's dissertational councils.

Preparation for the publication of the JINR Annual Report for 2026. Preparation of materials for the INIS system.

Scientific and organizational support and preparation of materials of JINR's governing and advisory bodies.

Prompt interaction with representatives of Member States and states participating in the activities of JINR on the basis of bilateral agreements in the fields of scientific research. Organization and holding of meetings of joint cooperation committees. Interaction with international organizations.

Organization and holding of contests for JINR Prizes, preparation of materials for nominating candidates for memberships in academies of sciences, for conferring honorary titles, for awarding medals and other decorations.

Study of the history of the development of JINR as an international intergovernmental scientific organization. Expert and analytical support for the JINR Museum of Science and Technology, including the historical archive.

Scientific and Educational Programmes for the Training of Highly Qualified Personnel

Theme leaders:

G.V. Trubnikov
D.V. Kamanin
W. Badawy

Participating countries and international organizations:

Armenia, Azerbaijan, Belarus, Bulgaria, Cuba, Egypt, Kazakhstan, Mongolia, Russia, Serbia, South Africa, Tunisia, Uzbekistan, Vietnam.

The problem under study and the main purpose of the research:

Development and implementation of human capacity-building programmes in JINR to meet the demands of the Member States in highly-qualified specialists, as well as to provide for supply of scientific and engineering staff for the needs of the Institute is a key task, which includes work with various target audiences, counting schoolchildren and school teachers.

For these purposes, the UC, together with universities of JINR Member States, creates conditions for students and PhD students from universities in the Member States to enable them to work on their qualification theses based on research conducted in the laboratories of the Institute, supports activities of JINR-based university departments in the hosting country, participates in creation and development of network training programmes, trains students, PhD students, and interns on the basis of cooperation agreements with universities of JINR Member States, as well as international organizations. An important component of human capacity-building activities is organization and running of international student practices and schools for young people from the Member States of the Institute; building and maintenance of educational and laboratory infrastructure intended for hands-on training in scientific and engineering disciplines; support and further development of the system of training courses aimed at gaining or improving professional skills and qualifications of JINR technical and engineering personnel.

Development of JINR outreach programme aimed at promotion of modern science achievements among school students and teachers, organization of excursions and online tours of JINR main facilities; participation in science festivals, exhibitions, and forums promoting JINR; development of cooperation and interaction with school educational centres; design and production of information materials for JINR information centres, administration of the UC groups in social media.

Expected results upon completion of the theme stages or projects:

Participation in the development of lecture courses and seminars for students and PhD students of the JINR-based departments of Russian universities.

Training of students and PhD students in JINR on the basis of cooperation agreements with universities from JINR Member States and other countries.

Support and further development of the Engineering and Physics Training Workshop for students and PhD students from JINR Member States and partner countries.

Support of the system of assigning Institute employees to JINR for preparation of their PhD theses without completing the academic programme of the PhD course. Participation in the Institute system of attestation of scientific personnel.

Organization and running of JINR student programme "START", online programme "INTEREST", international student schools and practices.

Launch of the short-term Advanced Science Programme for Young Researchers and Engineers ("ASPYRE") in JINR.

Creation of organizational prerequisites to ensure JINR contribution to national human capacity-building programmes for large-scale infrastructure projects in JINR Member States and other partner countries.

Further development of the licensed system of training courses aimed at acquiring or improving professional skills and qualifications of technical and engineering personnel of the Institute.

Implementation of the advanced training programmes for school teachers from JINR Member States.

Support of Dubna Interschool Physics and Mathematics Open Classroom and science programmes for school children, interaction with educational institutions and natural science programmes for school children.

Further development of the network of JINR Information centres.

Supply of JINR-based departments in partner universities and JINR information centers in the Member States with electronic and printed materials, information resources.

Organization and running of the JEMS programme to further promote and expand contacts with universities and educational centres in JINR Member States, Associated Members and partner countries.

Development of printed and electronic popular science information materials promoting the Institute and modern scientific achievements for use in educational processes.

Extension of JINR partner network through further development of educational programmes.

Expected results in the current year:

Support and supervision of the educational process at JINR-based departments of Russian universities, explore possibilities for extended stay in Dubna for senior course students.

Support of the system of assigning young researchers to JINR laboratories for preparation of their PhD theses.

Organization and running of the International Student Practices in JINR fields of research for university students from JINR Member States. Synchronization of practices for South Africa and ARE and the preceding science schools. Attraction of new countries for participation in the programme.

Organization and running of JINR student programme "START" (summer and winter sessions) and online programme "INTEREST" (spring and autumn waves). Attraction of new leaders of educational programmes from among young scientists.

Development of organizational prerequisites for JINR human capacity-building programmes for national large-scale infrastructure projects at the requests of Member States and interested partners.

Organization and running of joint scientific events and schools with partner universities at JINR, targeting junior course students.

Support and further development of an information system on preparation of qualification theses by students and PhD students from universities of the JINR Member States in the Institute laboratories.

Increased load of the Engineering and Physics Training Workshop for students and PhD students from JINR Member States, as well as young JINR staff members, further development of existing laboratory training workshops, development of training workshops at LINAC-200. Further development of educational programmes on accelerator arrangement and beam diagnostics, on electronics based on chip programmed logics.

Regular work of the language courses programme aimed at teaching Russian as a foreign language and English to JINR personnel in a club format. Extension of the range of studied languages.

Running of skill development and refresher courses for JINR technical and engineering staff and regular training in labour safety.

Organization of scientific schools for physics teachers from JINR Member States, including those run in English.

Extension of educational programmes for high school students from JINR partner countries.

Further development of virtual tours of JINR main facilities and video conferences with educational institutions in JINR Member States. Organization and support of science schools for school children and group visits to JINR for JINR-based university departments and information centres.

Expansion of the user community of the "Engineers of the Future" educational and methodology complex in JINR hosting country, adaption of parts of its materials for use in other JINR Member States.

Organization of JINR participation in science festivals, run by universities in JINR hosting country and trial participation in science festivals in other JINR Member States.

Opening of JINR Information Centres in new locations in the hosting country and other Member States.

Organization and running of the JEMS programmes in accordance with the international cooperation plan.

Abstract and scientific rationale:

The integration of science, education and the achievements of modern technologies is becoming especially important as one of the most important factors for the development of the economy and the social structure of a society based on knowledge-intensive technologies. To solve these tasks, it is necessary to combine the efforts of various universities and research centers to create new training courses and research practices.

The Joint Institute for Nuclear Research, as an international organization, which unites member states, associate members and dozens of collaborating universities from around the world, offers its solution to this problem in the form of the implementation of the project "Open information and educational environment for supporting fundamental and applied multidisciplinary research at JINR".

Project purposes:

– use of modern educational technologies for the preparation of university students and improving the qualifications of specialists for work at JINR;

- attracting talented young people from the participating countries and countries cooperating with JINR to participate in research projects of the Institute;
- implementation of the results in the field of fundamental and applied research obtained at JINR into the educational process in the member countries and associate members of JINR, expanding the geography of cooperation;
- cooperation with the world's leading scientific centers and universities in the field of creating educational resources for physics teachers and high school students;
- increasing the awareness of fundamental and applied multidisciplinary research conducted at JINR and the JINR brand among a wide audience, publishing of courses prepared by leading JINR specialists on international platforms of open education;
- creation of educational and exhibition content on JINR topics at the level of leading scientific centers.

Expected results upon completion of the project:

Information support of the main areas of fundamental and applied research at JINR.

Creation of online courses and new educational programs on the subject of the Institute's activities for modern educational platforms.

Development of a project in creation of virtual, remote and hands-on practicums for the study of nuclear physics and applied research.

Development of exhibition activities devoted to the achievements of JINR and modern science in the Russian Federation and JINR partner countries.

Creation of multimedia resources and web solutions to support JINR information centres.

Creation of digital educational materials and research practicums for schoolchildren to study physics and biology at an advanced level in schools of the Russian Federation and partner countries.

Creation and implementation in the educational process in Russian schools of an educational and methodological complex for studying physics at an advanced level "Physics 7-9. Engineers of the Future".

Expected results of the project in the year:

Creation and development of an information system for supporting applied research at the NICA accelerator complex.

Cooperation with NRNU MEPhI in the field of creating online courses in nuclear physics, engineering, atomic and related technologies and their further publishing at the educational portals of JINR (edu.jinr.ru) and NRNU MEPhI (online.mephi.ru), and website physics-engineers.ru.

Using augmented, extended and virtual reality to prepare exhibition stands dedicated to the main facilities and experimental research at JINR.

Development of a virtual practicum on radiobiology.

Development of a platform for remote practicums together with iThemba LABS.

Development of hands-on practicums and new virtual laboratory works on nuclear electronics and the basics of ionizing particle detection.

Organizing practices and workshops for university students and teachers as part of the development of the Virtual Laboratory project.

Creation of a series of videos on the use of carbon-free energy sources and the basics of experimental nuclear physics for schoolchildren for educational institutions in South Africa.

Creation of new electronic educational materials for the support site of the educational and methodological complex for studying physics at an advanced level in Russian schools "Physics 7-9. Engineers of the Future."

Creation of electronic educational materials for the elective course "Nuclear Physics" and the course "Introduction to Nuclear Physics and Nuclear Electronics" for university students and senior students of specialized schools, including research practicums in nuclear physics (hands-on, virtual and remote).

Activity of the theme:

Name of the activity		Leaders	Implementation period
Laboratory	Responsible from laboratories		Status

LRB	A.N. Bugai, I.V. Koshlan, E.A. Nasonova		
DLNP	D.V. Naumov, V.A. Rozhkov, M.V. Shirchenko		
FLNP	N.A. Fedorov		

Abstract and scientific rationale:

The problem of training engineering personnel is common not only for Russia, but also for other JINR partner countries. To solve this problem, it is proposed to update the curricula and develop educational and methodological complexes.

Improving the level of physical and engineering education is impossible without including in physics courses information about the modern picture of the world, examples of the development of new technologies at the intersection of physics, chemistry, biology, radiobiology and astrophysics. JINR as an international multidisciplinary scientific center has all the capabilities for this.

Within the framework of the project (activity), it is planned to create new curricula and textbooks for studying physics at the basic and advanced (aimed at training future engineers) levels of basic general (7-9 grades) and secondary general (10-11 grades) education.

Considering that physics is an experimental science, within the framework of the proposed project (activity), a modern practical course will be developed with a large number of laboratory and practical works aimed at developing students' research and engineering skills. The key component included in the teaching and methodological complex is a support site with an electronic format of textbooks, a media library of digital educational resources for schoolchildren, as well as various methodological materials for the teacher.

Goals of the activity:

- to increase interest in studying physics and engineering activities among schoolchildren, and as a result – to increase the level of knowledge of physics for further education in technical universities and colleges;
- to develop materials for methodological support of physics teachers in the implementation of new teaching and methodological complexes in the educational process;
- to participate jointly with the Russian Academy of Sciences in the development and implementation of a unified state textbook in schools;
- to conduct an examination of the created teaching and methodological complexes within the framework of expert procedures of the Russian Academy of Sciences and the teaching community;
- to implement the project results in educational programs for the study of physics in schools and universities of the JINR partner countries.

Expected results at the end of the activity:

Creation of four teaching and methodological complexes for studying physics at the basic and advanced (aimed at training future engineers) levels of basic general (7-9 grades) and secondary general (10-11 grades) education:

- "Physics 7–9. Basic Level";
- "Physics 7–9. Engineers of the Future";
- "Physics 10–11. Basic Level";
- "Physics 10–11. Engineers of the Future".

Development of a modern laboratory practical course for Russian schools, including the use of ICT, and publication of a corresponding teachers' guide.

Implementation of the project results in the Russian Federation and interested countries. Creation of an information environment for the teaching community to use the project results.

Expected major results in the current year:

Development of the concept of educational and methodological complexes for studying physics at the basic level of basic general and secondary general education.

Preparation of the manuscript of the unified state textbook on physics for basic general education at the basic level (grades 7–9).

Preparation of the unified state textbook on physics for secondary general education at the basic level (grades 10–11).

Conducting an expertise of textbooks in the expert council of the Russian Academy of Sciences and the educational community. Preparing textbooks for publication by the Prosveshcheniye Publishing house.

Development of a support website for the educational and methodological complex "Physics 7–9. Engineers of the Future".

Development of laboratory, research and practical works for a physics practicum using information and communication technologies and "smartphonics".

Development of media resources in English or other languages for studying physics in schools in JINR partner countries.

DIAS-TH

Dubna International Advanced School of Theoretical Physics

Theme leader: E.A. Kolganova
I.G. Pirozhenko

Participating countries and international organizations:
Armenia, Russia, Serbia.

The problem under study and the main purpose of the research:

The Dubna International Advanced School of Theoretical Physics (DIAS-TH) is a scientific and educational project aimed, firstly, at training senior students, post-graduate students and young scientists on research topics of the Laboratory of Theoretical Physics, priority scientific areas of JINR research and modern areas of physics. The second goal of the project is to expand international cooperation and attract young scientists from Russia and the participating countries to JINR.

Project in the theme:

Brief annotation and scientific rationale:

The Dubna International Advanced School of Theoretical Physics (DIAS-TH) is a scientific and educational project that has successfully been developing at the N.N. Bogolyubov Laboratory of Theoretical Physics since 2003.

The project is aimed, firstly, at training senior students, post-graduate students and young scientists on research topics of the Laboratory of Theoretical Physics, priority scientific areas of JINR research and modern areas of physics. For this purpose, schools of various levels are regularly held for students, postgraduates and young scientists from the JINR Member States and other countries, and lectures are published. In addition, review lectures on problems of modern physics are organized for JINR staff. Both researchers of JINR Laboratories and internationally recognized scientists from scientific centers of the Russian Federation and foreign scientific centers are involved in giving lectures. Lectures given by the world's leading experts at DIAS schools stimulate the emergence of new areas of research at BLTP. The project provides in-depth training in the field of modern theoretical and mathematical physics. To this end, the project participants cooperate with the JINR University Center, as well as with the JINR-based Departments at Dubna State University, Moscow Institute of Physics and Technology, Moscow State University.

Secondly, the project is aimed at dissemination of scientific knowledge, namely, informing schoolchildren and people who are not professionally engaged in science about the achievements of modern theoretical physics, in particular, about current research at BLTP. In addition, one of the objectives of the project is to encourage young scientists to cooperate with BLTP JINR.

Expected results upon completion of the project:

Within the framework of the project "Dubna International School of Modern Theoretical Physics", in educational activities it

is supposed to organize regular schools on JINR priority topics and modern scientific areas for schoolchildren, students, post-graduate students and young scientists from the JINR Member States and other countries; to carry out review lectures on problems of modern physics for JINR staff; to continue/renew cooperation with scientific organizations of the Russian Federation and foreign scientific organizations, higher educational institutions in educational activities; to participate in the educational activities at the JINR-based departments of Moscow State University, MPhI, MIPT, Dubna State University together with the JINR University Center; to organize schools for students, graduate students and young scientists in cooperation with the Moscow Institute of Physics and Technology, Yerevan Institute of Physics, etc.; to take part in international scientific and educational projects.

In the dissemination of physical knowledge it is planned to collaborate with other projects promoting popular science, such as Post Nauka, with foundations of the Russian Federation (Science Foundation of the Russian Federation, Federal Target Programs) and international foundations in organizing and conducting international schools for students, graduate students and young scientists.

It is also planned to support the DIAS-TH website, to provide video broadcasting of lectures, to record the video of lectures, and to support the digital archive of DIAS-TH.

Expected results of the project in the current year:

Organization of schools on theoretical physics for students, post-graduates, and young scientists at BLTP:

- DIAS Winter school (Chairman of the Organizing Committee, I. G. Pirozhenko);
- International Summer School “Advanced Methods of Modern Theoretical Physics: Integrable and Stochastic Systems” (Chairman of the Organizing Committee, M. Hnatic).

Organization of one-day lectures/discussions and regular seminars for students and post-graduates and JINR researchers.

Computer processing of video records of lectures, support of digital archive of video records.

Support of Web-site of DIAS-TH.
